Another instance is the issue of wrong material from the store; and where the difference between certain parts is very slight, mistakes must at times occur. Yet that is no reason why the foreman should operate upon the part in question, and, when the job is finished and rejected by the inspector, absolve himself from all blame. As a matter of fact, he is, often defaulting, quite as much to blame as the acknowledged department, especially where his technical knowledge is of greater value than the commercial experience of the storekeeper. It may be that two classes of the same-diameter bright-steel bar—exact and commercial—are kept in store, and that several bars of the commercial quality are inadvertently stocked with the exact. The job in question specifies "exact," and the "out-of-place" bars are sent out. The storekeeper cannot always detect the fine difference between the two, but the foreman can, and here also the skill of the operator should be apparent for he is handling the material and should detect the difference.

If the job is proceeded with, then the foreman incurs grave responsibility, which he should not be allowed to evade. It does not, of course, lessen the responsibility of the storekeeper, but it obviates the worst effect. The material should be at once sent to the inspector, and upon this individual's report the storekeeper is indicted. In like manner, also, the assembling-shop foreman has responsibilities, and because the storekeeper in error sends out a wrong part that does not mean that the foreman has the right to assemble it, assuming this can be done It only needs a little cooperation and a normal sense of duty to obviate a good many troubles, and, after all, it is the foreman who is primarily concerned and who will reap the greatest reward.

The responsibilities of the progressman are so obvious that he has little opportunity of shelving them; still, he will endeavour to do so. Even though the foreman is expected to look ahead, and see that material and tools are available before putting the job into process, it is not always with deliberate intent that he does not do so. He is not infallible, and is therefore liable to mistakes like ordinary mortals, and he does not have a lot of spare time upon his hands. The progressman has responsibilities in this direction, for he knows the work which must be put in hand, and he can prompt the foreman as the time draws near. Some hours before, he can say, "Now, about so-and-so job. Are the tools O.K. and the material applied for?" His good offices are not always received with the gratitude they deserve, but they are usually effective, and the result is his reward.

He, too, can advise the storekeeper for with a miscellaneous collection of requisitions it is necessary to have some idea of their relative urgency. Some foremen err on the side of being premature and apply for material on Tuesday which is not wanted until Friday. Valuable time on Tuesday is thus taken up with an order which must lie for several days, whereas that time could have been applied with greater advantage to a much more urgent (though received later) order. The progressman can assist here, for he knows better than anyone else the relative importance of each requisition.

The storekeeper, in his turn, must not

*From Mechanical World.

be hide-bound, for though he is strictly within his rights in dealing with the requisitions in rotation, there are times when a little deviation from the rule is an advantage. Assuming that the foreman has omitted to apply for the material until it is actually required, it is not helping maters for the storekeeper to stand upon his dignity and to declare in no uncertain voice that the order must take its turn.

He must remember that he, too, is a producer, and if he allows an operator to remain idle for a considerable time when he could have prevented it, then he is not doing his duty, and must take his share of the blame when trouble follows. It is of no use for him to flourish rules and regulations—to say that he must have the agreed-upon notice before he can supply material to any requisition. This will not help him, unless he can prove to the satisfaction of the management that by handling this requisition out of its turn other important orders must have been delayed. And usually he would have some difficulty in proving this.

He may say that this would dislocate his system and rob his department of efficiency, seeing that the foremen would not trouble about placing their requisitions early. He, however, has his remedy, for he can report the delinquent, and he need not be afraid of constant repetition. But, first of all, supply the goods; obviate, or at least minimise, the effects of blundering, and then protest. That is the business-like way.

The Inspector

The inspector is another whose responsiblilities are manifold, and who exerts a tremendous influence upon the shop output, and, also, costs. Abiding by the strict letter of his instructions he may consider himself immune from censure, but such is not the case. Even the management, which insists upon rigid inspection, will criticise the decisions of the inspector, and the wholesale scrapping of work will bring down the vials of wrath not so much upon the head of the foreman responsible for the work, but upon the head of the man who, strictly speaking, has done his duty—the inspector.

It behooves the inspector, therefore, to adopt a common-sense policy—to recognise that business is a grim reality and must not be played with. It is not to say that he must bend to the will of the shops; that work, no matter how bad, must not be rejected. It is the inspector who sets the standard of quality, and good workmanship consistent with the function of the piece must be insisted upon. Wholesale scrapping of work for technical inaccuracies, however, will not enhance his reputation; and, again protest (if one be necessary) must, if possible, be deferred, in order to allow manufacture to proceed.

The indifferent worker arranges that his product will just pass the nspector, that is to say, it is not up to the standard desired, but yet it is not bad enough for rejection. The inspector notes the fact, and is obliged to pass the work, but he takes care to state upon his report that that work is not as it should be. The next job also is indifferent, and again the fact is recorded; but after a times the inspector comes into his own, for he is able to turn a batch of work back again to the operator. In this he has the backing of the management, for his previous forbearance stands him in good stead. He has vindicated himself as an inspector whilst not forgetting his obligations as a producer.

Comprehension Necessary

Comprehension is a quality vital to every business, and must be well to the fore in the composition of every person possessing executive powers. The rate-fixer has responsibilities not less than those of the other individuals mentioned for he, as the others, can either facilitate or retard progress. He may be a stickler for system, and to all intents and purposes understand his job, yet his contribution to the factory output is of the negative variety. And why is this? Simply because he sticks to that which is written, and refuses to deviate by even a hair's breadth. The rate is fixed, but the operator loses money. He refuses an allowance, and the operator leaves. Enter another, but the result is the same. So no progress is made. He may be right in his calculation, but his method of application is wrong. He lacks comprehension.

The list may be further extended and many more instances quoted, but sufficient has been said for our purpose. No man has the right to think solely of himself and his job, for whether he be operator, foreman, inspector, progressman, storekeeper, rate-fixer, draughtsman, or works manager, he is first and foremost a worker, and as such is directly responsible for output. It must not be inferred that the abolition of all rules and regulations is suggested, or that the system should be thrown upon the scrap-heap. That would, of course, make confusion worse confounded, and the last state of affairs worse than the first. But rules and regulations and systems are capable of broad interpretations, and the man who is so wrapped up in his own job that he cannot see its effect upon the other fellow's is not so efficient as he imagines.

He may be able to show a clean slate, and to boast while he is walking upon the firm path, others are floundering in the mire. But what answer can he give when asked how many he has pulled out of the mire; and what can he say to the suggestion that he has pushed a few in? For his own sake he needs be careful, lest in a fit of exasperation one of the flounders pulls him in.

The helping hand is at times necessary, and although perhaps it is slightly soiled by the contact, it is a business proposition. It is of no use to take the stand that "He is responsible—not I." It may serve for a time, but sooner or later the management realises that, although not directly responsible, you could have obviated the bad effect. Then you may expect your just reward.

STEAM LOCOMOTION OF FUTURE

(Continued from page 53)

December 8th issue

Comparing the results obtained at St. Louis with the compound superheated locomotive with those obtained at Altoona with simple superheaters, we find that the compound used 10 per cent. less water than the simple superheated engines at low pistons speeds of 400 ft. per minute, and at 800 ft. per minute the consumption of the compound and the simples were alike. We gather from this that for freight service of a heavy character, moving at low speeds, compound engines, provided they are fitted with superheaters, might, from the point of view of fuel and water economy, profitably be employed. So far as practice in this country is concerned, and we write from this viewpoint, we can foresee certain difficulties of a practical nature, due to our restricted loading gauge, making it difficult for designers to find room for sufficiently large low-presure cylinders. An alternative would be to use a six-cylinder engine having three low-pressure cylinders with their respective high-pressure cylinders superimposed, two sets outside and one set between the frames. with cranks at 120 deg. We make the suggestion being aware of its short-comings; however, heavier train loads in the interest of economical working may yet enforce generally unlooked-for developments in locomotive designing.

Taking what we may call a panoramic view of the world's locomotives and considering their devepoment on the various great lines in the old and new worlds, we think that engineers in this country have been in the van of progress. The multi-cylinder engine has been developed here to a point surpassing that attained elsewhere, and we believe with satisfactory results. For ourselves, while recognising to the full the benefits arising from the use of four cylinders, we are inclinded to favour the three-cylinder engine as being a medium between the simplicity of the two-cylinder and the more complex four-cylinder locomotive for fast passenger service, and we are inclined to favor the three-press services either the three or four-cylinder engine with superheated steam, using perhaps higher temperatures than we know to-day, will be the locomotive of the future. For freight traffic w may in time come to see the compound reappear, and it will have a superheater and will be built when we make up our minds to run heavier freight trains under the control of a continuous brake.

"Things to watch and methods of speeding up filing" will interest everyone connected in any way with the trade. Look for this special feature in the January 5th issue of Canadian Machinery.

DEVELOPMENTS IN SHOP EQUIPMENT

COMBINATION LATHE, GRINDING AND DRILLING MACHINE

The Electric Motor Mfg., Co., Ludington, Mich., have recently developed a machine that is of the combination type and is sold under the trade name of "Utility." The machine is designed to handle a wide range of repair work requiring lathe, drilling and grinding operations. The machine is driven by an electric motor and is intended for bench use. The grinding wheel is mounted on the shaft, while the lathe spindle is driven from the motor shaft by gears.

BENCH DRILLING MACHINE

The Model Specialty Co., New York, have recently placed on the market a portable bench drilling machine weighing only 34 pounds. The machine is intended for accurate work and all-round shop use. The column is high enough to permit objects up to eighteen inches in height to be drilled. The table can be tilted to any angle and locked in position. The spindle is driven directly from a motor, and the head carrying the spindle and the motor, can be located at any point on the column and locked.

HARDNESS TESTING PUNCH

The Case Hardening Service Co., Cleveland, Ohio, have recently placed on the market a punch for quick hardness testing by the Brinell method. A spring hammer in the barrel delivers to a ¼ inch steel ball inside the cap at the bottom, a blow of sufficient force to make a depression of three millimeters diameter or less, according to the hardness of the test piece. The test is accomplished by gripping the knurled barrel of the punch and pressing downward quickly until the spring hammer is released.

FRICTION TAPPING MACHINE

The Geometric Tool Co. of New Haven, Conn., is introducing a tapping device known as the Jarvis F. D. It has a friction drive, that is controlled by the pressure exerted on the machine spindle with which the device is employed. Little pressure is necessary to drive the tool, and the stopping and starting of the tool is obtained independently of the spindle. The device is equipped with a standard chuck. The tapping range is from "0" to ¼ inch. Light holes in tough metal can be tapped.

VERTICAL AUTOMATIC CHUCKING MACHINE

The Vertomatic Manufacturing Co., Reading, Pa., has brought out a Vertical Automatic chucking machine in several re-designed types. The Type A is intended for work requiring a series of from three to five operations at one setting. Type B is for work requiring two or three operations. The two machines are identical in construction except that Type A has six chucks and five active spindles, while Type B has four double chucks and three pairs of spindles. By providing one less spindle than the number of chucks loading and unloading can be accomplished without interfering with the continuous operation of the machine. Type C machine is for work requiring but one operation or two operations performed by a combination tool. Types A and B are indexing machines. The spindles remain stationary while the chucks are fed to the tools independently of each other, at the desired speed and to the proper height, by the use of cams.

On the Type C machine each spindle is mated with a certain chuck and operates on the work placed in that chuck. The chuck and the spindle turrets are locked together and rotated in one direction. As the chucks leave the loading station they run up a continuous cam so that the work is raised to the tool in the spindle. The work is ejected when returned to the loading station. The machines are automatic thoughout.

STANDARD PUNCH AND DIE SETS

The Diament Tool and Manufacturing Co., Newark, N. J., have standardized a number of Punch and Die Sets, and are manufacturing them on a quantity production basis. These standard parts are complete punch and die sets in every respect except the die openings and the holes for inserting punches in the punch-plate. That is to say the following parts are standardized;—punch holder, die blank, stripper plate, punch plates, liner pins, liner pin bushings, and the dowels and screws. Then when a new die is designed its special parts and features can be readily machined. Thus it can be quickly assembled and ready for use. Several designs and styles of punch and die sets have been standardized and anything within a wide range can be made up on short notice and with little special labor.

RULE FOR OXY-ACETYLENE CUTTERS

Mr. K. McDermott, assistant mechanical engineer of the South Chicago Works, Illinois Steel Co., has devised a convenient rule for metal cutters who use the oxy-acetylene blow pipe. It is in the form of a nickel plated hand rule about 12 inches long by 1⅛ inches wide, and ⅛ inch thick. It is so graduated as to indicate the tip sizes of oxygen pressures best suited for cutting steel sections of any thickness up to 7 inches. This rule is graduated on one side for use with the "Oxweld" and on the other side for use with the "Davis-Bournonville" tips. The device is simple and can be easily applied. Tip sizes and pressures are read off directly thus dispensing with reading thickness in inches and fractions, and all references to a cutting table. The device saves time and eliminates waste. The idea is not patented and anyone can easily make a rule of this type adapted for the equipment being used.

ADJUSTABLE REAMER

The Standard Tool and Supply Co., Mason City, Iowa, have recently designed and placed on the market an adjustable reamer known as the "Larson."

It has been developed to ream the bushings of automobile pistons. In use the reamer is inserted through both bushings and then expanded by turning the adjustable nut so as to permit the spring in the reamer at the opposite end to actuate the cutter blade. Proper alignment is secured by reaming both bushings at once. One complete turn of the adjusting nut enlarges the reamer 0.001 inches. The cutter blade is of the double edge type so that it can be rotated in either direction. It can be readily sharpened, replaced or shimmed up.

HEAT TREATING INSTRUMENT

The Gibb Instrument Company, Detroit, Mich., have disposed of the patents and maufacturing rights of the "Crit-Point" instrument, used in hardening steels, to the Illinois Testing Laboraties, Inc. of Chicago, Ill. The instrument has been completely redesigned and is being placed on the market, by the latter firm. The device is made in two types; model 220 P. is a portable unit, which is used by attaching it to a conveniently located electric light socket; model 220 W. is intended for use as a permanently installed instrument in

connection with suitable switch and wire arrangements. This arrangement permits the use of one large instrument on several furnaces. Modifications of the fire-end are possible to permit use with special shaped articles under unusual conditions.

GAUGE PRESSURE REGULATOR

Alexander Milburn & Co. of Baltimore, Md., have placed on the market a pressure regulator intended to control the delivery of acetylene, oxygen, hydrogen, and other gases under high pressure such as are used in welding. The device is said to maintain a constant pre-determined pressure regardless of fluctuations in the initial pressure line and variations in consumption at the torch.

ADJUSTABLE BORING BARS

The Power-Vosberg Co. of Detroit, Mich., have recently placed on the market through their selling agent, The Firmhil Machine Supply Co. of Detroit, Mich., a line of adjustable boring bars made in three styles, the angle adjustable, straight adjustable, and removable types. The bars will bore holes from ⅞ inches diameter to 15 inches diameter. The bars are intended for both rough and finish boring and reaming and can be used on drilling machines, lathes, boring mills and other tools.

ALL-GEARED MILLING MACHINES

The Oesterlin Machine Co. of Cincinnati, Ohio, has placed on the market a line of milling machines of the constant speed, or all-geared type, consisting of six sizes each made in the plain or universal style. The speed mechanism furnishes sixteen geometric speeds through fifteen gears and one shaft, in addition to the spindle and pulley shaft. Speed changes are obtained by "two-position" levers and a "four-position" knob, and may be made without stopping the machine. Automatic lubrication is effected by an ingenious three tank system. The system is practically fool proof and one supply of oil is sufficient for about two months of ordinary service. The driving pulley of each machine is 14 inches diameter and runs at 400 r.p.m. A brake is connected with the belt shifter mechanism, which stops the spindle quickly. The feed box, knee, and table are similar to the cone top of millers built by this firm.

BENCH BROACH PRESS

A power broach press of the bench type has been recently placed on the market by the American Broach and Machine Co. of Ann Arbor, Mich., The machine is designed not only for push broaching operations but also for pressing into place or removing mandrels, bushings, etc. The machine is belt driven by a pulley 1 inch in diameter and taking a 2½ inch belt. Power from the pulley shaft is transmitted through a worm and worm gear and thence to a spur pinion that meshes into a rack on the spindle, or ram. The worm gearing has a ratio of 30 to 1. The worm is arranged to disengage automatically at the end of a predetermined stroke, through the medium of an adjustable collar on the upper end of the ram. The ram then automatically returns to its top position. The machine has a stroke of 14 inches and the bore in the table is 2½ inches in diameter.

SNAP GAUGE MICROMETER

In order to eliminate the necessity of having a large number of snap or limit gauges on hand, the J. T. Slocomb Co., of Providence. R. I. has brought out a duplex micrometer, intended for use as an adjustable limit snap gauge. The gauging surfaces are the anvils and spindles of two micrometers, which are set in the frame of the instrument. This design enables any dimension within the range of the micrometers to be gauged by merely setting one spindle to the "GO" dimension and the other to the "NOT GO" dimension. Provision is made for locking the spindles after thy have been set. A patent covering the instrument has been applied for.

CONNECTING ROD ALIGNING FIXTURE

A fixture for testing the parallelism of holes and the twist in automobile engine rods is now being manufactured and marketed by the Allen Wrench and Tool Co., Providence, R. I. The wrist pin end of the rod is placed in a sliding block that slides in a "V" slide so as to accommodate various lengths of rods. The large end of the rod is fitted with a special bushing and pin and registers against two vertical circular posts. Errors can be seen or can be gauged by feelers. It is possible to gauge a rod on which the piston has been assembled. For general garage use it is necessary to provide two arbors for the large end of the rod, one for Ford cars and one for other makes of cars. A complete set of bushings for the fixture ranges from 1¾ inches to 2½ inches by eighths. It is claimed that inaccuracies of 0.001 can be detected. A pair of bench vise jaws are supplied as auxiliary equipment for use in straightening rods.

POWER CROSS FEED FOR TILTED TURRET LATHES AND SCREW MACHINES

A compact power cross feed to the cut-off slide, has recently been developed for the Nos. 2, 3, 4, 5 and 6 Tilted Turret lathes and screw machines, manufactured by the Wood Turret Machine Co., of Brazil, Ind. This design of power cross slide allows casting the apron or gear box integral with the saddle proper and insures rigidity as well as permanent alignment of these parts. The power is transmitted to feed screw by means of two bevel gears on lower feed shaft meshing with a third gear on a vertical shaft, thence through helical gears to the feed screw.

A single lever control allows of feed engagement in either direction by simply moving through three positions. When the lever is in a vertical position the feeds are disengaged, while throwing lever to the left engages the feed to travel in. Moving lever to right reverses feed causing it to feed outward. Six feed changes ranging from .003 to .023 per rev. of spindle are provided, any one of which is instantly available without stopping machine.

Provision is made to safeguard the feed mechanism against overload or accident by providing a brass shear pin on the lower feed shaft. This pin is easily replaced should it become necessary. The feed nut is made of bronze and is of the solid flanged type which allows it to be held in place by two cap screws. The feed nut being bolted to the back side of saddle allows it to be easily removed without disassembling the other parts. A large dial is fitted on hand wheel which is graduated to .001. Provision is made for clamping this dial at any point.

The feed screw is provided with two bronze bearings in the out board end of slide and which gives an extra long support. An ingenious method of taking up the back lash of feed screw in this bearing, is provided by means of a knurled adjusting nut which is locked by hand wheel. Positive screw stops are mounted front and rear which control the depth of cut when using forming tools.

OIL RECLAIMING OUTFIT

The S. F. Bowser & Co., Inc., of Fort Wayne, Ind., have marketed an outfit that is adapted to reclaiming different kinds of lubricating oils, but especially intended for use on oils used in internal combustion engines. The apparatus is said to restore oil to its original viscosity, flash point, and purity. The outfit is made in two sizes with capacities of 50 and 100 gallons respectively per twenty-four hours.

A SPECIAL MACHINE

A special machine for cross cutting and boring railway sleepers has been supplied by a British firm to oversea's railway. This machine is designed to cut and bore sleepers up to 10 ft., and to cut out the seatings for the rails. A special feature is the manner in which the boring spindles are driven by a series of four endless roller chains running in horizontal paths, each chain being arraged to drive two spindles. This method has been found very advantageous compared with the belt drive formerly employed in this type of machine. It is of course a great convenience to a large railway to have one machine which can rapidly carry out the special operations which railway sleepers require.

Make the Most of Your Time

THE young man who makes a habit of standing around the streets at night with the gang may see a lot of traffic go past, but there is more passing him than just traffic. Every moment he wastes with the gang in seeming pleasure can never be retrieved. He may, later in life, wish lost time back again, but wishing will never bring back the past. Opportunity may have flown, his youth may be gone, and all he will have left is bitter regret.

Time and time again young men have been warned against loafing. In some cases the warning has been heeded. If any young man has been frittering away his time, not necessarily at the street corner, for there are many ways of wasting time and energy, let him read the story of Jack Neal's advancement on another page of this issue. Where would Mr. Neal have landed if he had not applied himself assiduously to the task at hand. The chief cause of his advancement was that he made it a point to learn more than the average man at his own particular business. It pays to be a leader, and as Mr. Neal says, "The best formula for success is hard work."

We have often emphasized the advantage of being able to read blueprints, and Mr. Neal's experience bears out our statements. In his case it worked wonders. Let every reader of Canadian Machinery make up his mind to cut waste of time and energy to the minimum, making the most of every spare moment. Increase your knowledge, then watch yourself advance.

Didn't Know It Was Loaded

EVERYONE is familiar with, and has smiled in a superior manner at the man who gets shot with a gun that he didn't know was loaded. That there are other things than guns that can contain a deadly charge has been the experience of a man in Ontario during the last few days. His experience has been a terrible one, in that he has lost his right hand, and as the man was an expert mechanic, the meaning of such a loss can be appreciated by all those who work with their hands.

This man was engaged in some repairs on a pump, and during the course of his work, had occasion to remove a nut, perhaps the piston nut itself, or one of the follower bolts. In any case, he had the rod and piston out of the pump, and in order to make the work a little easier, or to make sure of not breaking anything, he took it over to a small blacksmith's forge fire, and put the piston in the fire, holding the rod by the other end. He had only had it there a few seconds, when an explosion occurred, and the piston was torn violently asunder, one piece travelling up the rod in a straight line, and in its course cutting off the hand of the man holding it.

The cause of the accident, of course, was that water had in some manner got into the piston, very probably between the rod and the bore of the piston, or through a porous casting into the piston itself. Its admittance and accumulation would be a slow process, but its raising to boiling point and subsequently to steam was a process of seconds only at the high temperature and comparatively large quantity of heat available in the forge. Once more that terrible force, the force of molecular expansion, was called into being, and the frail metal was shattered and with it a man's hand. We have called attention before in these columns to the energy contained in even small quantities of water which have been raised to high temperatures and pressures, and here is another melancholy and painful example to give warning. Never put anything in a fire to heat unless you are morally sure that there can be no water contained in it, and if there is, that there is ample room for the vapor to find its way out as fast as it is formed. Of course, we know that such an accident is not frequent, and it is to be hoped will never become so, but the danger is always there, and no one has a right to take a chance. If he does not know of the danger, he cannot be blamed, but every man who is engaged on work around engines and boiler rooms should know these things, or have them drawn to his attention by the man who does.

MARKET DEVELOPMENTS

Finished Steel Market Very Quiet This Week

Production of Steel Ingots in November Was 44 Per Cent.—How Production and Consumption Compare—Metal Markets Somewhat Stronger—Small Tools and Machine Tool Market Quiet Losses Are Less Than One Per Cent.

ALL MARKETS report very little activity this week. Pittsburgh presents some interesting figures on production and consumption. The production of steel ingots in November was at practically the same rate as October, viz., 44 per cent. However, the rate fell to 40 per cent. on December first. There is a slight declining tendency at present, and as a few mills will likely close for the last week or two this month, or the first two weeks in January, we can expect a drop in production at whatever period they close.

The direct consumption of steel in nails, tin plate, many forms of sheets, oil country goods etc., is practically normal, and is greater than in 1910, but the consumption in construction is decidedly light, this making a big hole in consumption in general. The demand in machinery making is also very light.

Montreal reports very little activity in any line. The rail mills are rapidly completing their orders and there are no more in sight. The steel demand is light and the conditions prevailing for the past few weeks have not altered. Machine tools are hardly moving, but portable tools seem to be in fair demand. Non-Ferrous metals are stronger, copper being especially active.

Toronto reports a spotty market. Metals are quite a bit stronger but this is the only bright spot. Copper, tin and lead, are the three strongest items. The steel market reports only a fair demand, while machine tools are very quiet. The supply market is also weak, repair parts being the only thing in demand.

NOVEMBER PRODUCTION OF STEEL INGOTS ABOUT 44 PER CENT. CAPACITY

PITTSBURG.—Production of steel ingots in November was at practically the same rate as October, 44 per cent. of capacity, as indicated by the report of the American Iron and Steel Institute giving the production of the 30 steel companies which made monthly reports.

These are simply averages for the respective months, and a closer analysis can be made. September had shown a rate of 32 per cent. against 30 per cent in August. The figures, confirmed by current information obtained in the trade, indicate that production was rising during October and falling during most of November. Roughly speaking the rate rose from 40 per cent. October 1, to 50 per cent. November 1, and that fell to 40 per cent. December 1, and that is substantially the rate at present. There is no more than a slight declining tendency just now, but a few mills will likely close for the last week or two of this month, or the first couple weeks of January, producing a dip in production at that time. The point is that mills in general have been making a special effort to run for the purpose of providing their workmen with some holiday money.

What everyone is interested in, of course, is how production and consumption compare, with what may reasonably be expected for the future. There has been a good bit of loose thinking on the subject of whether business has been bad or good and how it is likely to be in the next six months. Right now there are predictions that steel business will be "good" by early spring, and other predictions that it will not be "good" before the middle of the year. When put in that form the predictions seem to be opposed, and yet investigation shows they are not so much opposed after all. The difference is not so much in the tonnage demand that men expect, as it is in the tonnage they take as a basis for making "good" business. This divergence arises from the fact that capacity has increased so greatly. In ingots, capacity is now about 52,500,000 gross tons a year. Prior to 1912, the largest production was the 25,200,000 tons made in 1910. Prior to that, 1906 and 1907 were years of great activity all around, and production in each year was about 22,000,000 tons. A 50 per cent. operation now, however, would make 26,000,000 tons. Considering how much construction work, railroad development and general steel consumption there was in 1906, 1907 and 1910, a 26,000,000 ton production in 1922 would look fairly large. On the other hand a 50 per cent. operation would look quite small. It is chiefly on account of this difference that some observers predict that business will be good and some predict that it will be poor. Both are thinking, probably, of about the same tonnage, a rate of production in the first half of next year of between 26,000,000 and 37,000,000 tons, which would be between 50 per cent and 70 per cent of capacity, big one way, small the other way.

A great deal of harm to business is being done by two things, first, the concept that "iron is the barometer of trade" and second, that business cannot be good until freight rates are reduced. Rates in general will hardly be reduced in less than about three months, and they will not be very greatly reduced even then. It is wasting time to wait on the reduction.

As to iron being the barometer of trade, that used to be a good and useful adage, but the difficulty is that men do not think of the total tonnage that is consumed, but of the capacity that may be idle. By a long range comparison it would be a big thing for the United States to make 26,000,000 ton-

of ingots in 1922, but from the erroneous viewpoint there would be the terrible condition of 26,000,000 tons capacity being idle. Population in 1922 will be approximately 19 per cent. greater than in 1910. There is no larger percentage of the population desirous of working (as was shown by the census report recently issued on the gainfully employed) and the individual does not work harder than in 1910. A production of 30,000,000 tons of ingots in 1922, allowing for the increase in population, would mean the same amount of activity in the production, fabrication and utilization of steel as occurred in 1910, a busy year. It can therefore be argued that if more steel is to be made and used men will have to discontinue doing something else, and other industries would have to decay.

Channels of Consumption

The direct consumption of steel, in nails, tin plate, many forms of sheets, oil country goods, etc., is practically normal and is greater than in 1910. The consumption in construction is decidedly light, and that is the chief thing that makes such a hole in consumption in general. Consumption in machinery making is at the moment relatively light but plainly will increase since machinery, tools, etc., are essentials for the common everyday activities of the people. From this viewpoint the country can be decidedly active and prosperous in the first half of 1922 without giving steel producing industry anything like full employment. Automobile factories, foundries and machine shops, mines and factories generally can be very active, and get all the steel they need without the steel industry operating at more than between 50 and 75 per cent. and incidently they may get it cheaper, which certainly will not be to their disadvantage.

The Markets

The finished steel markets generally have been very quiet in the past week, and that is the chief reason for the above digression. The quieter conditions began about the middle of October and the quietness increases as the year-end is approached. Tubular goods are an exception, there having been quite an active demand up to date, there being heavy demand for line pipe, moderately heavy demand for oil country goods generally, and a fair demand for standard pipe. The mills are operating on an average at between 70 and 75 per cent. the best rate shown for any of the finished steel products.

Finished steel prices show scarcely any change at all from week to week. Orders individually are so small that there is little incentive to make further cuts. When demand broadens and buyers are ready to take hold, as to tonnage, in a more liberal way, there will probably be some further price recessions, but these will be slight, not at all comparable with the large declines that were occurring up to last August.

POINTS IN WEEK'S MARKETING NOTES

Steel ingot production in November is about 44 per cent. This is practically the same rate as prevailed in October.

The finished steel markets have been very quiet during the past week. Tubular goods are an exception, for there is still an active demand for line pipe, a moderate demand for oil country goods generally, and a fair demand for standard pipe. Pipe mills are operating on an average between 70 and 75 per cent., this being the best rate of any of the finished steel products.

Pig iron and coke remain dull, with prices open to concessions, if fair sized competitive orders come into the market.

The Canadian Pacific Railway is said to be planning extensive operations for 1922. Details of this programme will not be announced until early in the New Year.

Montreal reports no change in base prices on the steel market. Generally speaking the market is firm, but trading is very light. The rail mills are rapidly completing their orders, and it looks as if they may have a quiet two or three months before them.

The pig iron situation in Montreal has not changed any during the past week. If the proposed hydro-electric development schemes go through, also some other large undertakings, it would mean considerable increased business for foundries throughout the country.

The metal market shows a better tone than for some time past. Copper displays more strength than at any time since the last big slump. If the present demand continues for two or three weeks more, it will mean a general steadying influence all around. Copper keeps well above 17 cents for three grades, and tin still commands 37½ cents. Lead is also going strong.

Standard lines are not selling as well as special supply parts. A Toronto dealer tells an interesting story regarding this unlooked for activity. Manufacturers evidently intend repairing old goods, rather than purchase new articles.

In the past week line pipe has been cut somewhat more deeply, while casing has been cut in some instances. Wire products have very largely slid back to the prices ruling before the advance of September 12, but it is claimed small orders are still commading the advanced prices. This would mean that the market stands at $2.50 to $2.60 for plain wire and $2.75 to $2.90 for nails.

METAL MARKET SHOWS SIGNS OF ACTIVITY

TORONTO.—There is no change in conditions on the local markets with the exception of metals. The metal market is showing continued signs of activity, and copper is especially active. Since the New York market picked up, Canadian business has likewise strengthened, of course this is natural, for we always reflect conditions on both the New York and London markets. Copper is selling around 17½ cents depending on the grade, tin can demand and get 37½ cents, while lead is selling at about 6½ cents. Dealers are of the opinion that the present improved condition is here to stay. If the demand does continue for another two or three weeks, it will have a decided strengthening effect on the whole market. From present outlook dealers will get their wish. In another portion of this issue we publish an article on the relative freight charges on pig iron and scrap metal. Although the conditions stated in this material apply only to the U. S. it will prove interesting reading, for, while the relations are not the same in Canada, there is no question but that the rates on scrap metal are very high. In fact so much so, that it is impossible for dealers to ship scrap for any great distance. One dealer tells this story:

"We had a chance to purchase some scrap," he said, "and the manufacturer wanted us to pay him $2.50 per ton for the material. So far so good, but we found that the freight charges to carry the scrap to the nearest destination was $6.70 per ton, so of course the deal was off." In other words the freight charges would have been almost three times the cost of the metal.

Steel Markets

The continued good weather has been of some use to the steel market, and while business is by no means brisk, some lines are still moving. Sheets are selling at a fair rate, and reinforcing material is also being bought up at a moderate speed. One dealer claims that the busines closed so far this month would tend to make him believe that December will be a better month than November. Prices remain the same nor is there likely to be any change for some time.

Machine Tool Market

As far as machine tools are concerned there is not much activity. A few odd machines are being sold here and there, but nothing to write home about. A peculiar point was brought to light this week while on our tour, regarding the supply market, that is machine tool supplies in general. "You know," started off a certain dealer, "this is the funniest market I have ever experienced. Instead of our standard lines selling strong, it is the specials that are moving, while our standard lines continue to rest peacefully on our shelves."

"Take for example chain blocks," he

continued. "During the last few months we have received orders for (here he mentioned a very large amount) worth of repair parts for chain blocks alone. What holds good in this line, is equally true in other lines. People are simply refusing to buy new goods, but are patching up the old ones.

They think this is a wise policy, but it's the old story of a penny wise and pound foolish, for in many cases they pay almost as much for the repair as they would for a new article. It may seem economy, but to my mind it's mighty foolish practice, forgetting altogether the axe we have to grind, so far as selling them new goods is concerned."

To prove his point, this dealer led the writer to the shipping room, where resting peacefully in a corner was a chain block that had seen better days. It was rusted up, and loose at many points; in fact was over 50 per cent scrap. "Can you imagine anyone sending that thing in for repairs," asked the dealer, and we could only shake our head negatively. "When we finish the repairing of the block, we won't guarantee its safety," concluded our informant, "yet they keep on inspecting elevators, and leave people to patch up chain blocks as they see fit."

This brings up an important point, and one which should not be overlooked. True, firms may be eliminating all unnecessary expenditure, but if deciding on repairs, it should first be ascertained if a new part would not be cheaper in the end, and above all, if the repaired part would be safe for use.

Small Tool Market

Our old stand by, the the small tool market is still a deserter from the ranks. Business is very quiet, and dealers are not over optimistic as to the near future. "We may get a little better business after the close of this year," commented one dealer, "but so long as manufacturers continue to buy for immediate requirements only, the volume closed will not be large."

BUSINESS IS VERY DULL THIS WEEK NOT MUCH DEMAND FOR MACHINE TOOLS

MONTREAL,—December is usually a dull month in the iron and steel industries, even when conditions in general are normal, but under present conditions business is a little duller than usual. At this time of the year programmes and policies for the coming year are usually well considered, and a more or less active start has been taken to put them into being. This year has been unusual in as far as the elections were concerned, and many firms who have more or less extensive dealings with firms in the United States, have hesitated to take any steps in connection with the coming year's business. The reason for this, although not definitely stated, has been one of "Safety First." Not one of these firms seriously thought that the tariff walls would be torn down should certain parties be elected to power at Ottawa. There was, however, just enough concern, to cause them to wait until after the results were announced before starting on the plans for 1922.

Conditions in most business circles were so quiet that such tardiness would not be followed by any serious results. Thus it is today, there is a feeling that something has been passed which presented dangerous features to Canadian business activities in the manufacturing line. The reaction in the form of increased business has not yet been manifested locally, but there is an undercurrent of optimism that cannot be concealed. Prices for the principal steel products remain unchanged. The business moving is practically the same as last week. A slight decrease in volume of business is expected for the next few weeks, as during the Christmas season the steel trade always experiences a quiet period. Nevertheless, although no actual business increases can be reported locally, the decks are being cleared for action in 1922.

The Canadian Pacific Railway is planning fairly extensive operations for the coming year. Mr. Hall, vice-president is now in the Western provinces arranging the programme, details of which will not be announced until early in the New Year. The increased earnings of the National Railways are very gratifying and it is sincerely hoped that these favorable balances can be maintained. In Nova Scotia the small volume of business being handled by the steel companies is resulting in a great deal of hardship and unemployment. It is confidently expected that this condition will be remedied very soon.

The Steel Market

Base prices locally are unchanged this week although there appears to be a few odd lots of steel being offered at prices that would suggest liquidation. Generally speaking, the market is firm. Merchant bars are still unusuall quiet, while there is a small, but steady movement in structural shapes. Sheets continue to move a little more freely than other lines, but the volume of business is still small. The demand for plates is better than one would expect. A considerable amount of tank and stack work seems to be in progress. The rail mills are rapidly completing their orders and there appears to be a quiet two or three months before them. No changes in prices are anticipated. The steel mills claim that the small margin of profit existing at the present price level is not attractive and that when a change in prices occurs it will be an upward revision.

Pig Iron Market

The conditions prevailing for the past few weeks have not been altered by anything in the last week. Some of the larger plants report that inquiries go to show that there will be more or less hydro-electric development in Canada and that other large undertakings are receiving serious consideration. If most of these materialize the foundries will be in receipt of considerable business and the demand for pig iron will be increased. There has been no change in price during the last week and there has been no additional demand.

Machine Tools and Supplies

The machine tool market remains unchanged. A few scattered price reductions are about all there is to report. The small shop man continues to be the most prominent purchaser in many lines. Some of these shops are unusually busy, as the closing down of the larger shops has thrown a great deal of business in the way of the small shop.

Supplies continue to move in about the same volume as before. Reports of sales of special portable tools to garage and repair-men are quite interesting. Many manufacturers are paying particular attention to the development and marketing of special portable or bench tools. It is surprising too, the interest that is being taken in these tools and also the excellent performance of some of them. It would appear that this type of tool is here to remain and will add considerably to the amount of total sales in the machine tool line.

Non-Ferrous Metals

The metals seem to be very firm in price, New York markets are reported as being stiffer than for some time. Locally there has not been much in the way of increased demands. Copper prices are still well above 17 cents for three grades. Tin still commands 37½ cents. Lead is commanding an exceedingly high rate. There is considerable speculation as to when the price of lead will break. It still has the distinction of being the only metal that is above the 1914 price.

London Markets are a little stiffer this week but the increasing rate of sterling exchange also enters into the calculation and offsets matters somewhat.

Scrap Metal

It is so long since there has been any activity in this market that scrap dealers have been almost forgotten. There must be a very small supply of scrap iron in the yards of the foundries and it would seem reasonable to expect that there would be a slightly increased demand in the near future although it is not expected that there will be any real revival before the spring business of 1922 opens up.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

INDUSTRIAL NEWS

The Canadian Brill Co. has supplied the Winnipeg Electric Railway with five one-man safety cars.

Plans are being prepared for ore concentrators and bunkers to cost $1,000,000 for the Britannia Mining and Smelting Company, Britannia Beach. B. C.

The ratepayers of Hull, Quebec, passed a bylaw authorizing the expenditure of $289,700 for the following improvements: aqueduct $83,700; sewers $85,500; paving $80,500; viaduct $40,000.

Galt reports that the textile and shoe industries are busy, but the foundries are running below average. In spite of the latter, there is little unemployment.

Kingston, Ontario has another new industry under way. This is the Kingston Factories Ltd. which has installed machinery and will start on the manufacture of overalls, shirts, etc. About 75 persons are to be employed.

Belleville, Ontario reports that contracts for construction on new building of The Ontario School for the district, have boomed business with several planing mills and one of them is employing a night shift.

Edmonton, N. B.—Mr. J. E. Michand states that lumbering business in Madawaska is picking up and that quite a few jobbing contracts have been taken out the last few days.

American branch industries at Sarnia, are running practically at normal. The Imperial Oil Co. is continuing to employ three shifts of men at 8 hours each. Conditions at this plant are looking up and officials report the future outlook as bright.

Surveys are being made for an electric light and power distribution system in Kerwood, London, Oxford Centre, and Muntey, all situated in the province of Ontario. The respective costs will be $38,000, $125,000, $40,000 and $35,000.

Elliott & Whiteal', Galt, manufacturers of small tools, report some improvement in demand from the motor car industry. Changes in certain part designs are, in a measure, responsible for this, and also a tendency toward preparedness for Spring business.

The Roelofson Elevator Co., Galt, have completed the installation of several new freight elevators in the recently constructed wing of the Lang Tanning Company, Kitchener.

The Frontenac Floor and Wall Tile Co., Kingston, Ont., are erecting a grinding plant for Feldspar for the manufacture of floor and wall tile. Formerly they have had to export the rough feldspar for grinding and import the crushed rock.

Major Anthes, president of the Anthes Foundry, Toronto, Ont., has just returned from a two months' business trip to Western Canada. He reports there is business to be had for those who go after it.

Esquimalt, B. C., reports that a contract for piling at Cofferdam for drydock costing $4,300,000 for the Dominion Government, Department Public Works is placed with MacDonald, Watson and Wither, 520 Sayward Building Victoria, B. C.

St. John, N. B. — Announcement is made that Wm. W. Quinton, assistant superintendent of Nashua mills of the Nashua Manufacturing Co., has resigned to accept the position of agent of the Hansaboe Manufacturing Company in Valley Falls. (R.I.)

The Canadian Government has signed a contract with the Burrard Dock Co., for a large floating dry dock for which the Burrard Co. are to receive a subsidy of 4 per cent. in two and a half million dollars for 35 years.

Sydney, N. S.—The marine railway and dock of the Sydney Foundry and Machine Co., are very busy at present. At the main docks two C. G. M. M. steamers are undergoing extensive repairs. The marine railway is taxed to capacity, many schooners waiting their turn to be placed on the slip.

If the present plans of the London division of the Canadian Pacific Railway are carried out next year, eighty miles of new 100 pound rails will be laid on the company's lines between Toronto and London. Appropriations for this new track-work have been drawn up and submitted to the head office of the company at Montreal for approval.

Annapolis, N. S.—A contract has been let this week by the firm of Wright and Joudrey of Annapolis, for the installation of 150 H. P. Hydro Electric plant. The turbine will be supplied by the Morgan Smith Co., New York; the generator and switch board and all electrical apparatus will be installed by the Canadian Westinghouse Co.

The British Empire Steel Corporation are to erect a large wharf on the site of the old reserve coal pier at Sydney where the company's freight and stores of all kinds will be consigned. The intention is to have all the supplies and freight required by the corporation shipped by water to Sydney during the navigation season.

New Glasgow, N. S.—English capital to the extent of £5,000,000 has been pledged to finance the development of oil shale fields in Pictou County. This is the aftermath of a conference in New York of the holding company and representatives of British oil magnates and the petroleum executive of the British Government.

St. John, N. B.—Joseph W. Norcross, vice-president and managing director of the Canada Steamship Lines, Ltd., arrived here and spent the day in conference with Thomas Nagle of the firm of Nagle & Wigmore, agents for the Canada S. S. lines. Mr. Norcross said that as wages and freights come down, the shipping outlook improves. His company will have considerably more business here this winter than last season.

The Ruggles Motor Truck Co., London, Ontario, announce that its working force is 50 per cent. stronger than a month ago, business having shown a decided change for the better during the past two weeks. The Dominion Government has placed a contract with the firm for eleven trucks for mail service and an order for thirty trucks has been received from England. In addition the demand for trucks from local firms is again noticed, the combined results being that the factory is working at full blast.

There are no signs of a slump in the vicinity of St. Catharines, Ont. The Crocker-Wheeler plant, which has been taken over by an English Company expects to run full time after Christmas, and it is said they have a large contract to get out. It is also understood that the McKinnon Industries is employing about 700 men now on part time.

It is interesting to note that we have in Canada 1,255 mills of which 400 are commercial. The capital invested in these is over $76,000,000. It is also reported that during the last ten months the construction companies in Canada have entered upon 17,824 projects, costing $204,375,000. Of these 17,824, over 3,000 were industrial buildings, costing approximately $92,000,000.

Additional contracts have been let for the erection of the market building at Windsor, Ont., to cost $150,000.

The F. B. Coombe Furniture Co., Kincardine, Ont., are in the market for additional wood-working machinery.

The contract for the erection of Sherbrooke's new City Hall has been let to the Sherbrooke Construction Co. The estimated cost is $75,000.

Tools and Stampings, Toronto, has been incorporated with $50,000 capital to manufacture machinery, tools, dies, etc.

The Central Steel Products, Toronto, has been incorporated to manufacture metal products with $40,000 capital stock.

The Hastings Manufacturing Co., Toronto, Ont., has been incorporated to manufacture toys, hardware, household appliances, etc., with $40,000 capital stock.

The National Tire and Tire Apparatus, Toronto, has been incorporated to manufacture motor car accessories, etc., with $100,000 capital stock.

The Trudel Gasoline Saver Co., Montreal, Quebec, has been incorporated to manufacture machinery, automobile equipment, etc., with $100,000 capital stock.

The ratepayers of St. Thomas, Ont., have passed a by-law authorizing the erection of the Elgin Memorial Hospital which will cost approximately $165,000.

The Acton Canning Co., Acton, Ont., are in the market for grinding equipments, vats, etc., for proposed leach house which was recently destroyed by fire.

Mr. E. Grandier, of the Teasdall Hosiery Co., London, Ont., are in the market for hosiery-making machinery for their Port Elgin plant.

Fire losses in Canada during the week ending November 16th, 1921, are estimated in the Monetary Times, at $287,850, compared with $215,500 the previous week.

There is some talk about a new hotel being erected in Sault Ste. Marie, Ont., to cost about $600,000. The matter so far has been placed bfore the local board of trade. They have looked favorably upon it and will bring the scheme to the attention of the City Council.

The Kinleith Paper Co., St. Catharines, Ont., are in the market for a 24 inch lathe with a 15 foot bed. This concern is contemplating building a new paper-making machine for its own use, and should this occur additional equipment will be required.

Mr. W. N. Manning of the Sherlock-Manning Piano and Organ Co., London, Ontario, states that his firm is only ten carloads of pianos short of last year's business, having shown a remarkable recovery during the past month. He says "Its just like old times in the Western provinces and in the east it is better than ever before. We are getting more orders for pianos in Prince Edward Island than at any period in our history."

Amherst, N. S.—The plant of the Robb Engineering works is being closed down. All the boiler patterns of the latest type are being shipped to the Dominion Bridge works at Montreal. Their general manager, Mr. G. E. Newill, is also being transferred to Montreal.

The Continental Electric Co., 505 King St. E., Toronto, recently incorporated to manufacture suction cleaners, etc., has commenced manufacturing operations. It is the intention of the company to increase the capacity of its plant by installing additional equipment in the near future.

A contract for the faced brick for the new Mount Royal Hotel, Montreal, Que., has been let to Webster & Son. Further contracts involving $2,250,000 will be let within three months. These include the supplying of such materials as granite, wood frames, elevators, ornamental iron, and tile fireproofing.

C. N. Kirkpatrick, sales manager of Landis Machine Co., Waynesboro, Pa., visited their Canadian representative, the Canadian Fairbanks-Morse Co., last week. Mr. Kirkpatrick stated to Canadian Machinery that their business on the whole has been satisfactory, and that the outlook for next year was encouraging.

Mr. C. F. Meyer, assistant secretary of the Landis Machine Co., Waynesboro, Pa., has returned from a year's trip around the world. Mr. Meyer's itinerary included India, Java, China, Japan and the Hawaiian Islands. Mr. J.M. McNeal, sales engineer, of the same company has returned after a year and three months in England and the continent.

We understand that one of the largest industries in Oshawa, Ontario took back about thirty men last week and it is expected that more will be taken on early in the New Year. Local manufacturers, wholesalers, retailers and business men generally are to be asked to take part in the campaign just launched to revive business and give every man a job.

Another indication of activity in Brockville is the James Smart branch of the Canada Foundries and Forgings and the Wolthausen Hat Corp. The Smart firm is now working 40 hours a week instead of 24 hours as was the case from last June until September; while the Hat Corporation is on full time instead of two or three days a week as was the rule last winter.

Figures indicating construction activity for the Dominion of Canada for the month of November amount to $16,639,800 as compared with $15,399,200 in November 1920. The total projects making up this item of 16,639,800 are numbered at 1,884. 1,600 of these projects are from the Provinces of Ontario and Quebec combined. Ontario having 1,072 and Quebec having 528. The construction total for the month of November in Ontario totalled $11,725,000 and Quebec $3,276,100.

Building has been active in Sault Ste. Marie during the past season, construction to a total value of about $800,000 having been carried out. The big item in this expenditure is the new Court House, which is now nearing completion. This structure will cost about $400,000 when completed. A start has just been made on the $250,000 Technical school and the proposed addition to the High School there will cost $125,000.

The Alfred Herbert, Ltd., Coventry, England, announces that after December 31st, 1921, its New York office will be closed. All communications should be sent direct to Coventry, or to such branches or affiliated companies as the case demands. Mr. E. D. Mitchell who has been manager of the New York office will return to England the early part of the year and take up duties at the home office. Canadian Machinery readers will no doubt keep in mind that the above company have a branch office at Toronto, Ont., under the supervision of Mr. J. C. Blair.

The Dominion Steel Corporation have the specifications ready for a large up-to-date and modern machine shop, to be erected in Sydney. The building will be of steel and brick and the most modern and efficient machines are to be installed. The company has in view the centralization of all necessary machine work and repairs for their railways, collieries and steel plants. The shop when completed will be one of the largest and most up-to-date in Eastern Canada. It is said on good authority that work on the erection of the new shop will commence at an early date.

The Grand Trunk Railway has placed an order covering its rail requirements for 1922. Business was closed last week for 29,000 tons of rails, of which the Dominion Iron & Steel received 15,000 tons for production, at its Sydney plant, and Algoma Steel Corporation 14,000 tons at Sault Ste. Marie. The Grand Trunk rail orders, added to the C. N. R. recent placing of 40,000 tons in equal shares with the Sydney and Sault mills, bring the total for the two systems to 69,000 tons, which should keep the producers fairly well occupied for several months.

A report from Brockville, Ontario says that industries have taken on a new lease of life in the past two weeks, and labor conditions show gradual improvement over the recent summer months. They are also experiencing an industrial boom which should increase its population by several hundred during the next few months. The recent arrival of the Eugene F. Phillips Electrical Company of Montreal has strengthened industral circles in that city. It is understood that operations in connection with this firm will be commenced not later than March 8th, 1922, on the erection of a total of 15 buildings which ought to be completed by the first week of next November. All told the firm is to employ 500 persons.

"Things to watch and methods of speeding up filing" has been written with care for Canadian Machinery of January 5th issue. Look for it.

Preparations are now in hand for the erection of an eleven storey office building at the corner of Bay and Temperance Street, Toronto, by the General Accident and Assurance Co. of Canada. The building when completed will cost a half million dollars, and with the land included, the total cost will be close to a million dollars. The contract has been let to the W. M. Sutherland Co. of Toronto and they have bound themselves to have the new structure completed and ready for occupation November 1st, 1922.

Something like an industrial boom has hit Pembroke, with the beginning of operations by Maguire, Patterson and a new canning factory in Frankford. Match Co., the latter being the Canadian branch of the Diamond Match Co., of the United States. The first named concern is of English parentage and is supplying splints to the match company. About 200 hands are employed at present, but it is stated that when both industries are operating at full blast, some 2,000 hands will be required. There is scarcity of houses at present in Pembroke and considerable building is planned for the coming spring.

Work has begun on the erection of a new canning factory in Frankford. The canning industry in Frankford has been for years a strong industrial asset, and the destruction of the factory by fire last summer was a serious set-back. The intention is to erect a bigger and better plant to take the place of the old one. Evacuation is well under way and is giving employment to quite a number of men. No definite mention is made as to what canning firm this is, but we imagine it will be The Frankford Canning and Preserving Co.

Improvement in the labor situation is indicated in the latest reports available covering the whole of Canada. For two weeks ending October 22nd, employment was greater than at any time since the middle of last January. This encouraging fact is shown by the latest reports of the employment service of Canada, covering the operations of 5,504 firms. The index figures show 90.4 as compared with 89.9 for the preceding two weeks. The return from 5,504 firms showed there was an aggregate payroll of 692,184 persons, an increase of 5,971 since the previous two weeks. There were additions to that to the extent of 8,075 reported in 23 industrial groups, while contractions occurred in 14 groups involving 2,104 persons.

Mr. O. H. Anderson, of the National Steel Tire Corporation, Hamilton, Ont., says his company have an order for 1,000 cars to be repaired for the Lehigh Valley Railway. There are tentative orders on hand for repairs to 500 cars for the Canadian National Railway system, and 2,000 for the Grand Trunk. This would mean work for employees throughout the winter. Mr. Anderson spoke favorably of the car equipment industry in general and said that the repair of all cars now in operation upon the Canadian railway lines would keep all car repair shops in Canada busy for two years to come.

There is considerable activity in the lumbering camps this year, but at rates of wages that are in some cases, less than half of those of last year. Reports from Pembroke, on the Ottawa river, indicate that while $75 a month and board was about the average rate last year for bushmen, the wage this year runs from $25 to $35 a month and board. Moreover, unemployment is such that in eastern sections men have gone into the woods to work for wages only, hoping that changes in the working force may secure for them a place on the payroll. Much lumber has recently been sold to American buyers, but at prices that represent a loss on the original cost at high prices. Present conditions indicate that lumber will continue to be marketed at low levels next year and thus building operations should benefit by the encouragement thus developing.

OBITUARY

John McClary, founder of the McClary Mfg. Co., the largest stove plant in the British Empire, and probably the oldest active business man in Canada, died at his home in London on Sunday, 11th inst., after an illness of only one day. Mr. McClary was born on a farm near London on January 2, 1829, and with the exception of a short time in California during the gold rush of 1849, he spent his entire life in and about London. He served an apprenticeship at the tinsmithing trade, and at an early age, entered into partnership with his brother Oliver, starting the business which developed into the McClary Mfg. Co., of today. He is survived by two daughters Mrs. Theresa Gunn, whose husband, E. A. Gunn, now deceased was formerly secretary of McClary Co., and Mrs. Gartshore, wife of Lt.-Col. W. M. Gartshore, manager of the company.

STILL YOUNG AT 81

Fifty-five years in the manufacture of lumbering tools, has given to Thomas Pink, Pembroke, head of the Thomas Pink Co., a memory that is rich in reminiscences of the early days in the lumbering industry on the Ottawa river. To him, it does not seem so long ago that rafts of squared timber, with their cabins and crews aboard, floated down from the adjacent forests on their way to Ottawa, Montreal and Quebec. Then, as now, Eddy, Booth, Gillies and MacLachlan were prominent names on the river. To-day the passing of a drive of loose logs means nothing in the shape of excitement, while in the memorable days that are gone, the towns and villages en route were policed by volunteer companies, who in the majority of cases, were more than a match for the huskies who were inclined to tear loose and paint the town red. Mr. Pink today is young at 81. That is, he is in close touch with every detail of his business, is probably known personally to all his customers and has seen his industry thrive from small to large proportions as the result of the significance that attaches to his name on peevy, pike or canthook. He was born in Kent, England, and, early in life, came with his parents to Perth, Ont. In addition to his regular line, Mr. Pink operates one of the largest public garages in Eastern Ontario.

PRESIDENT OF A.S.M.E. ELECTED—PLANS LAID

Dean Dexter S. Kimball of the College of Engineering of Cornell University has been elected as president of the American Society of Mechanical Engineers. Dean Kimball succeeds Edwin S. Carman of Cleveland, and will serve for one year. He heads an organization of 15,000 members with active professional divisions and local sections in every principal industrial centre in the country.

Other officers elected were: Vice-presidents, Col. Edward A. Deeds of Dayton, Ohio; Robert Sibley of San Francisco and Louis E. Strothman of Milwaukee; managers, Sherwood F Jeter of Hartford, Conn.; Horace P. Liversidge of Philadelphia; Hollis P. Porter of Tulsa, Okla.; and Walter S. Finlay of New York; treasurer, William H. Wiley, of New York; secretary, Calvin W. Rice of New York.

With the election of Dean Kimball the society set in motion two important movements, one looking to world engineering unity and the other to remedy what engineers say are deplorable conditions in the United States Patent Office, menacing American industry and invention. In the campaign for better Patent Office conditions the society will work with other national engineering organizations.

Sir Robert Hadfield of London has addressed a communication to Calvin W. Rice, urging the formation of an Anglo-Saxon Engineering Council of the World. Steps are being taken by American engineers to co-operate with British engineers in the formation of a new national association. France and Italy will be asked to co-operate.

Ambrose Swasey of Cleveland said that the engineer and scientist, now the most important factors in war, purpose to devote their energies to the maintenance of world peace. The idea of an international union of engineers, he said, arose during the war and took concrete form last summer, when a deputation of American engineers went abroad to confer the John Fritz gold medal upon Sir Robert Hadfield of London and Eugene Schneider of Paris, head of the famous Creusot Works.

British engineers led by Sir Robert are

already moving to form a federation of engineers of the British Empire similar to the American Engineering Council, organized about a year ago under the leadership of Herbert Hoover, and by means of which American engineers are being welded into a single union.

INCREASED USE OF OIL FUEL BY SHIPS

Lloyd's annual report 1920-21, on shipping, refers to the many adverse conditions which have combined to the disadvantage of the shipbuilding industry. As far as the Register itself is concerned, this is illustrated by the statement that the new tonnage classed during the year ended June 30, 1921, only amounted to 911 vessels, of 3,245,-130 tons gross—equal to a reduction of 25 per cent. on those for the previous twelve months. It is noted, however, that whereas only one vessel exceeding 10,000 tons was classified in 1919-20, no fewer than ten such vessels were classed during the past year.

A special feature of the present report is the account given of the remarkable increase in the use of oil fuel to replace coal, as illustrated by the following comparative figures recorded in the Society's register book:—

Vessels burning oil fuel
gross tons

July, 1914.....	1,310,209
July, 1919.....	5,336,678
July, 1920.....	9,359,334
July, 1921.....	12,796,635

and it is stated that the position indicates that industrial conditions generally during and subsequent to the war have given tremendous impetus to this important economic movement.

Some impression of the industrial significance of the change will be obtained when it is realized that the steamers now in existence which are fitted for oil fuel would represent a consumption of coal approaching 20,-000,000 tons per annum, or about 8.7 per cent. of the quantity of coal brought to the surface in the United Kingdom during 1920. Apart from the question of the relative cost of coal and oil as fuel, continues trade commissioner Harrison Watson, there is undoubtedly, the case of vessels using the latter, an all-round economy of labor, bunker space, accommodation for crew, and time in port; factors which have an important bearing on running costs, more especially in the case of large passenger vessels.

This movement partly accounts for the remarkable increase in the demand for oil tankers, of which 112 of 614,-464 tons gross, or over 18 per cent. of the total tonnage classed, were built in the past year, and the growth of this type is exemplified by the following statistics:—

Tankers (steamers and motors)
gross tons

July, 1914.....	1,478,988
July, 1919.....	2,929,113
July, 1920.....	3,354,314
July, 1921.....	4,418,688

The total number of vessels built during the year and fitted with oil engines was thirty-four of 101,608 tons, twelve of which were ships of large size totalling 83,739 tons gross. All these thirty-four vessels were fitted with oil engines using heavy oil, with the exception of three of 536 tons fitted with paraffin motors.

Production and Uses of Lime

SPEAKING on the production of lime in the United States, Commerce Monthly says that although the production in 1920 was greater than 1919 the supply was insufficient to meet the steadily increasing demand, due in most cases to the shortage in transportation and labor. Approximately 140 different industries in the U. S. use lime in some form. Production in 1920 exceeded that of 1919 by about 240,000 tons and was more than 94,000 tons greater than the average production during the five years 1910 to 1914. As in most industries, due to the increased cost of materials and labor in 1919 and 1920, this expansion in output has been accompanied by a considerable increase in price. However, the slackening of demand and the liquidation in fuel and labor during the current year have caused a marked decrease in production costs and selling prices.

Limestone, from which the greater part of the lime produced is derived, is widely distributed throughout the United States, in varying degrees of purity. The amount of impurities in the raw material, such as silica, iron and alumina, determines the value of lime for its various uses. Quicklime is obtained by burning limestone under slow but constant heat sufficient to dissociate the carbonic acid gas from the stone, leaving the commercial product. Kilns may be intermittent or continuous. Intermittent kilns are used only by small producers as they must be cooled and re-heated each time they are charged. Continuous kilns are constructed at regular intervals, and the kiln recharged with limestone from above.

Used By Building Trades

The building trade consumed about 37 per cent. of the total lime produced in 1920. The decrease noted in the consumption of lime in the construction industries since 1916 reflects the shortage in house-building of the last four years. The largest consumption of lime in the building trade is in the building of homes, and if this type of construction had continued at the pre-war rate it is estimated that such consumption would have increased instead of decreased. The quantity of lime consumed in 1920 by the paper industry was the greatest on record, being 32 per cent. above the average pre-war consumption by that industry and about 9 per cent. greater than the consumption in 1919.

Hydrated lime is that which has been slaked under standardized conditions and expert supervision. A specific amount of quicklime is mixed iwth a certain quantity of water so as to produce a perfectly slaked lime which does not require slaking when used in making mortar. Hydrated lime serves most of the purposes for which quicklime is used and its prepared and finely divided condition provides a more economical and thorough distribution of the product with a minimum of waste.

Production in 1920 was more than double the average annual pre-war production, and the value of the hydrated lime produced in 1920 was the highest on record and more than five times the value of the average annual pre-war production. While the quantity of lime hydrated is only about one-fourth of the total production of lime, the relative increase in the production of hydrated lime since 1915 has been greater than the increase in production of quicklime. The number of plants reporting operation has steadily increased, and there were 98 plants in operation in 1920 as compared with an average of 67 during the five years 1910 to 1914.

Where lumplime is used, lime dust and small particles of lime derived from the burning process are hydrated. Some plants hydrate the entire output—all types of hydrators provide for mechanical mixing and for conserving the heat of the chemical reaction in sufficient degree to hydrate effectively without burning.

The older methods used in burning limestone were those in which the flame and fuel used came in direct contact with the limestone. Numerous small plants were used, especially in Pennsylvania where it has been the custom for farmers to burn the lime for their own use and to sell in small quantities to their neighbors. In 1916 there were in operation in the United States 778 plants which burned 4,073,000 tons of lime. Recently on account of high cost of fuel and labor there has been a tendency to concentrate the industry into larger production units. In 1920 a total of 3,476,-000 tons of lime was burned in 515 plants. Continuous vertical shaft kilns are now the standard. These are upright cylindrical furnaces consisting of iron or brick shells of various sizes lined with fire brick. Suitably insulated rotary kilns are used extensively in burning lime to be hydrated. The number of field kilns is being rapidly reduced and the more efficient and effective types of continuous kilns are being substituted.

More than 99.8 per cent. of the domestic consumption of lime is produced in

the United States, and nine-tenths of the imported lime comes from Canada. A small quantity of lime of a special grade is imported from Europe. Exports of lime from the United States have not exceeded one per cent. of the total production, and the greater part of the exports is sent to Canada.

Lime deteriorates when stored and any decrease in demand necessitates a reduction in the supply produced. Complete statistics of the quantity of lime consumed in 1921 are not available. However the National Lime Association estimates the quantity of lime consumed to date at about 80 per cent. of the quantity consumed during the corresponding period of 1920. It is probable that the improvement during the last quarter of 1921 in the various industries requiring lime as a raw material will be reflected in the final report of production and consumption during this year.

SHOULD FREIGHT RATES ON SCRAP BE REDUCED? COMPARATIVE FIGURES

INVESTIGATION of rates on "scrap iron" as compared with those on "pig iron" has raised the question whether the former are properly relative or excessive compared with the latter. Since scrap iron is now produced and used at a rate of 20,000,000 to 35,000,000 tons per year, depending on general business conditions, it is important, say Briggs & Turvias, Inc., Chicago, that we determine whether it is paying more than its share of freight. In this the producer, the consumer and the carrier are interested, as it effects their financial well-being.

Speaking further on the subject they say: "It is frankly admitted that a definite relationship exists between scrap iron and pig and when the price of one is relatively higher than the other, the proportion used is altered to fit the case, cheap scrap replacing pig iron and cheap pig iron replacing scrap. The freight rates paid on these, therefore, are of importance, as one suffers or gains compared with the other, if rates are out of line.

"If we compare pig iron and scrap iron rates between producing and consuming points," they continue, "it is surprising that in most cases scrap pays the higher rate. The contrary opinion has been held generally. The scrap rates are not only higher, but the differences are large in percentage. For instance, from Birmingham to Cincinnati, pig iron is favored to the extent of $1.245 per ton, or 28 per cent. From Chicago to Moline, the difference is $0.70 per ton, or 35 per cent. From Cleveland to Toledo, pig iron is favored $0.42 per ton or 17 per cent."

The basis for freight rates, according to their comments, ordinarily takes into account the market value of the commodities. Unless this were done, a carload of tea would yield no more revenue than a carload of pig iron. The same basis is used in levying taxes and duties. As a result, they remark, it would seem that scrap should move at a lower price than pig iron since its selling price always is lower. Three reasons indicate the justice of lower rates on scrap compared with pig iron. Scrap is considerably inferior, physically and chemically. Scrap always sells lower than pig iron; in the case of some grades as much as 75 per cent. lower; the loss in melting scrap exceeds that of pig iron by at least 3.1 and as a result, the scrap consumer pays freight on something which is a total loss. Thus, if scrap and pig iron each carry a freight rate of $1.00 per ton, this would cost the consumer $0.25 more on every dollar of freight on scrap compared with pig iron.

This would indicate that scrap rates should not be more than 80 per cent. of those on pig iron based on the melting loss alone, while the difference in claim figures on scrap iron and pig iron.

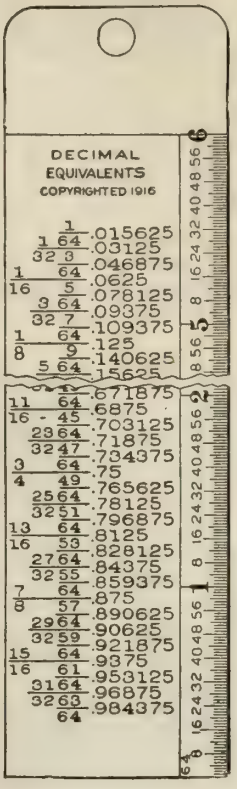
"Inasmuch as the tonnage and mileage of scrap is much greater than that of pig iron, this commodity should be entitled to much consideration," they continue, "while steel plants consume much of pig iron production of country at the point where it is produced, scrap, invariably, requires railroad transportation. In this carrying much of the scrap iron is handled twice—into a yard for preparation and again to the consumer. This material has not had privileges similar to the fabrication-in-transit and milling-in-transit accorded to structural steel and wheat. At present, it is impossible to move scrap any distance, as the rate for carrying is too close to the selling price to permit long hauls. In many instances, rates range from $6.00 to $12.00 per ton.

"In view of the large tonnage, long hauls and double hauls, it would seem wise for carriers to encourage shipment of scrap by placing rates low enough relative to pig iron to cause free movement."

Editor's Note: — The comparisons stated in the above article are very interesting, but should not be quoted as strictly applying to Canada. A prominent dealer in scrap metals, discussing the matter with Canadian Machinery says that there exists in Canada a very high freight rate on scrap metals, so high in fact as to prohibit the shipment of scrap for any great distance. To prove his point he tells the following story: "We had an opportunity to purchase some scrap a short time ago, and the manufacturer gave us a price of $2.50 per ton for the material. This was all right so far as it went, but the freight charge to the nearest destination would have been $6.70 a ton, which of course made the deal an impossible one, if any profit was to be realized. With the present existing carrying charges, dealers, or in fact anyone, cannot afford to ship scrap from outlying districts to any consuming locality."

NEW CATALOGUE

The Tastern Machine Srew Coroporation of New Haven, Conn., have just issued a very complete catalogue describing their H. & G. die head product. In fact the book is more than a catalogue as it contains many pages of information valuable to the screw machine operator. There are many illustrations which serve to clearly illustrate many points of an obscure nature. The catalogue describes Die Heads known as their type A, C, & D. The die heads are all hardened and ground, the chaser slots being ground to within one one-thousandth of an inch. The chasers are all operated by cams having a positive bearing directly over the cutting edge. The cams themselves are solidly supported by the body of the head thus rendering the tipping of the chasers impossible. The dies are opened by straight acting springs. All chaser sets are perfectly interchangeable. It is claimed that the head is one of the most compact for its capacity, of any on the market. The diameters of thread in the dies is the same at both ends.



Style A is designed to be used on automatic screw machines like the Cone, Gridley, National Acme and New Britain, and for threading machines and bolt cutters in which the die head rotates. Style C is for turret lathes, hand screw machines and similar designs of machines in which the die head does not rotate. Style D is specially designed for the Brown & Sharpe Automatics, but can be used on other machines cutting small work. It is claimed by the manufacturer that this type of head, recently placed on the market, is not only increasing production, but improves the finish and accuracy of the product. The catalogue also illustrates the H. & G. Chaser grinder, which has been developed by this firm to meet the demand among users of H. & G. die heads for a grinder that is readily operated by unskilled labor and grinds chaser correctly without undue waste of chaser stock.

WILL SPEND A MILLION

In spite of the difficulties which hinder the development of collieries in Great Britain one large colliery company has decided to spend over one million pounds on extending electrical working in its various mines. The main power house is to be extended until it becomes the largest private electric power station in the country. One of the resulting changes in the pits will be the complete electrification of all plant which can be suitably operated by electric power. A considerable reduction in working costs will be effected.

Have You Tried This Contest Yet?

The editors want to make Canadian Machinery as newsy as possible. Every week three or four pages of interesting and valuable news appear in our Industrial News Section, but we know there is a great deal more information to be obtained, the difficulty being to bring it to light. This is where we feel our readers can help us. Read the conditions stated below, then decide to help us **NOW.**

A word about the prizes. These scales are 6 in. long. They are made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is stamped on the one side, while a table of tap drill sizes is placed on the reverse side. Each scale is enclosed in a suitable case and every reader should strive to obtain one. Send in your item **NOW.**

What You Have To Do

As stated above, we are anxious to make our Industrial News Section still more valuable. Our readers can help us wonderfully in this respect, sending in each week, short items relating to industrial activities in Canada. These items **must** be real news and **must** not be clipped from other papers. A study of our present Industrial News Section will help readers to distinguish what constitutes a real news item and for their guidance we offer the following suggestions:

Let us have items dealing with the formation of new companies; reorganization of old companies; new factories to be erected; plant or factory extensions; changes in personnel of firms; appointments or promotions; contracts about to be placed; equipment or machinery required, or new equipment or machinery about to be marketed.

In every case the editor is to be the judge as to the value of any item received and he is at liberty to use or reject any material. A prize will be given to the readers sending in the best item, or items, each week and to make it interesting we will give two scales as prizes every issue. Make up your mind to secure one of these scales. They are well worth having. Obey the impulse, send in your item **NOW.** See page 28 for the winner of the December 8th contest.

— Important Note —

Readers should arrange to send their items so that they will reach the Toronto office early Monday morning of each week at the very latest. Of course, they should be forwarded before this if possible, but our forms close early Tuesday morning each week, and no matter can be used after that time. Should an item arrive too late for publication in one issue, if considered worth while it will be held over for another week, still being eligible for a prize.

FROM PATTERN-MAKER TO GENERAL MANAGER

FROM pattern maker to time keeper, foreman, superintendent, then general manager, is the story of the advancement of Jack Neal, of the Northern Foundries Company, Sault Ste. Marie. The story of how Mr. Neal got his advancement is probably duplicated by dozens of other factory men throughout the country, although each one may give a different explanation. Most men are modest, however, nearly all big men are, when they point to their rise in the world of finance, commerce or industry. Jack Neal is the same Jack Neal who came here 20 years ago to work for F. H. Clergue, who put the Sault on the map as a steel manufacturing centre of Canada. Neal came to the Sault, willing to work, with a good knowledge of pattern making which he had acquired at Carleton Junction.

"The only formula I know of to get on is real hard work," said Mr. Neal the other day in relating how he started out. "As a pattern maker I found that I had an advantage, in that blue prints were easy for me to read, and I soon learned the importance of capitalizing this knowledge outside of my own trade."

Mr. Neal confessed that he spent many nights getting through a correspondence course in mechanical engineering . He would not deny that he had a natural aptitude, which stood him in good stead, but he was firmly of the opinion that any young man requires more than natural ability if he is to achieve executive capacity in any industry to-day. Competition is too keen, even in the shops, for any man to depend on the store of his own knowledge, or his ability to grasp principles at first hand.

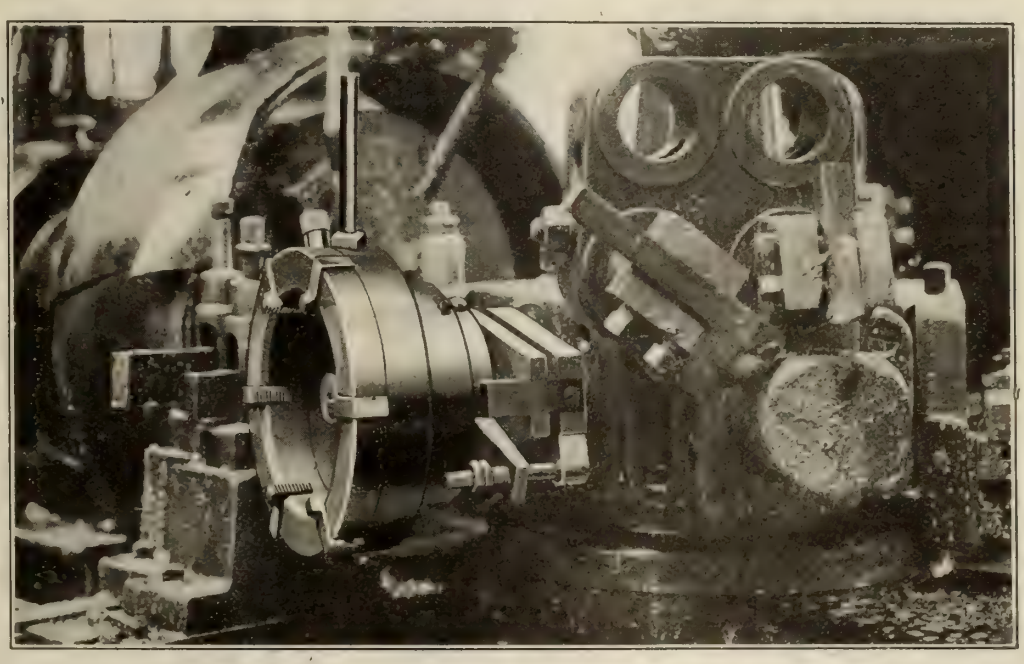
"Take any young man out in the foundry there," said Mr. Neal, "and he can not tell you what a blue print means unless he has the casting beside him, although he may be very practical, and expert in his work. I studied what I thought would fit in with my pattern making, and I try to keep abreast of new ideas every month in the technical publications of the trade. Iron working appeals to me, but 20 years ago, after a long day, it was hard work and required application to carry through a technical course in mechanical work at night."

Joining with a couple of other shopmates, Mr. Neal started a machine repair shop in the Sault. He was made timekeeper, but his general knowledge of the shop was regarded as too valuable, and he ultimately became superintendent. The Northern Foundries was born out of the repair shop, when the war came along, and like many other factories with nothing to do, it was a case of turning to munitions. Neal turned out the first 4.5 mark 7 shell to be finished in Canada without bushing or nose, and his prints were sent to Ottawa, as a pattern for other plants throughout the Dominion.

To-day, the Northern Foundries employs 100 men, and is manufacturing centrifugal pumps, steam hoists and steering gear, all used in the mining districts in the North. Jack Neal is the general manager, and he knows the cost of every casting turned out, whether in the brass or iron part of the foundry. He has jumped from war to peace time production safely, and his plant represents $250,000 of Sault capital.

A NEW KIND OF COAL

A report is existent that there is a new suggestion as to fuel—a new kind of coal. The idea comes from Norway and is the result of experiments carried out in a plant at Greaker, Norway, where an improved process has been employed to produce sulphite coal as a by-product from the manufacture of wood pulp. A ton of wood pulp, says the Scientific Engineer, yields 9 to 10 cubic metres of sulphite lye, of which 95 per cent. form other processes. If a new process is generally adopted it is estimated that it will be possible to produce annually sulphite coal equivalent to 800,000 tons of imported coal. Considerable quantities of cheap alcohol are produced from the wood pulp lye before it is made into coal. An essential feature of the new process is high concentration of the lye before removed from the autoclaves.



WILL FIND NEW USES

The U.S. Bureau of Mines, in a recent report, points out that the percentage of waste at slate quarries is very high. In order to reduce such waste they have undertaken the problem of discovering new and enlarged outlets for the waste material.

Many products such as paper, rubber, road asphalt, floor coverings, paints, etc., require as one of their important constituents a considerable percentage of finely pulverized inert mineral matter to give "body" to obtain the desired consistency, or to supply the necessary wearing or other qualities demanded. Such materials are known as "fillers." Eleven manufacturers of mechanical rubber goods found that slate flour was a satisfactory filler for such products as disks, sheet packing, molded shoe heels and soles, hard rubber battery jars, carriage tires, garden hose, clutch facings and similar products. Slate flour was used successfully as a substitute for whiting, clay, ground barytes and aluminum flake. A manufacturer of rubber footware found that products in which slate was used compared favorably with those made from regular compounds in tensile elongation and accelerated or natural aging.

Right on the Lead

A Big Job And A Big Die Head to Cut The Thread

In less than one minute's time the big 5⅜-inch Geometric Die Head cuts the thread on the bearing plate of ball-bearing journal jacks, and then releases automatically and makes way for the next tool.

The Foreman of Tool Supply in that Shop says he knows of no other tool that will do the work as they require it done like a GEOMETRIC.

Geometric Screw-cutting Tools help the man at the Lathe and at the Screw Machine give the best possible showing on a day's work. These tools are built to fit the work—to handle it in the easiest manner and produce threads that are true in every particular.

100 PER CENT. SATISFACTION

ATKINS Sterling Quality **SAWS**

When in need of Circular Metal Cutting Saws, Hack Saw Blades, Hack Saw Frames, Kwik-Kut Power and Metal Cutting Band Saw Machines we will be pleased to have your specifications.

"A BETTER SAW FOR EVERY USE"

Address the nearest point below

E. C. ATKINS & CO.

Canadian Factory, Hamilton, Ontario
Branch House, Vancouver.

Built to Give Satisfaction

BLOUNT Grinders are built to stand up under the hard service which is the usual lot of a grinder. They are just as good in every detail as we can make them. They are fast, accurate, strong and rigid —dependable in every sense. Let us send you full particulars.

"We will accept Canadian funds at par."

J. G. Blount Co.,
Everett, Mass., U. S. A.

DAVIS-BOURNONVILLE

Oxy-Acetylene welding and cutting torches, pressure regulators, hose, acetylene pressure generators, portable welding and cutting outfits, carbon burners for garages, welding rods and sticks, fluxes for cast iron, brass, bronze and aluminum, welding tables, vee-blocks, accessories and supplies.

Tips for cutting cast iron fit the regular D-B cutting torches, style C head.

THE

TRADE K–T MARK

FOUNDRY
GALT, ONT.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.

MORSE

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

"CANADIAN" MILL EXHAUSTERS

Handle Any Material

The Canadian Standard Mill Exhauster will handle any kind of material efficiently—sawdust, shavings, cotton lint, or stringy material, gases, fumes, smoke, etc.

They are adjustable to any angle of discharge instantly—have universal type of wheel and carefully constructed, self-aligning oil-ring bearings.

Catalog 410-77—gives technical data and prices. Write for a copy.

KEMPSMITH

No. 2 UNIVERSAL

Thirty-two years ago the Kempsmith Company began its career in a small one-storey frame building. To-day there are four main buildings, aggregating 106,000 square feet of floor area, besides various storage sheds, etc. Every building of the plant is a model of its kind.

It has always been, and will continue to be, the purpose of the Kempsmith Company to produce machines of the highest quality only, suited to the most advanced practice.

Every machine, whatever size or type, is put to test under cuts and conditions purposely more severe than it will encounter in even the most progressive shops and when it leaves our factory it has our positive and definite guarantee back of it.

Literature will be gladly sent upon request

OPERATED IN CONJUNCTION WITH A CONTINENT WIDE NET-WORK OF DISTRIBUTION STATIONS

"Liquid Air" Oxygen Means a Saving in Transportation

With a network of Factories not only planned but in actual operation, and a number of Distribution Stations situated at all large centres all over Canada, Purchasers of Oxygen can obtain their supplies at a point very near to the point of consumption. This comp'etely obviates heavy freight charges on cylinders and assures an immediate supply at any time within a few hours and often minutes after the orders are placed.

All cylinders conform to the specifications of the Canadian Railroad Board and are made to ensure safety without unnecessary weight. When purchasing "Liquid Air" Oxygen you not only save on freight, but in very many cases the cost of cylinder rental is eliminated.

SMALL TOOLS

Pratt & Whitney Adjustable Blade Reamers

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment.

The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced.

By a simple adjustment of the blades the reamer can easily be set to size, without regrinding.

Prompt service is assured at our nearest store, where P. & W. Small Tools are carried in stock for immediate delivery. Place your order there to-day.

PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

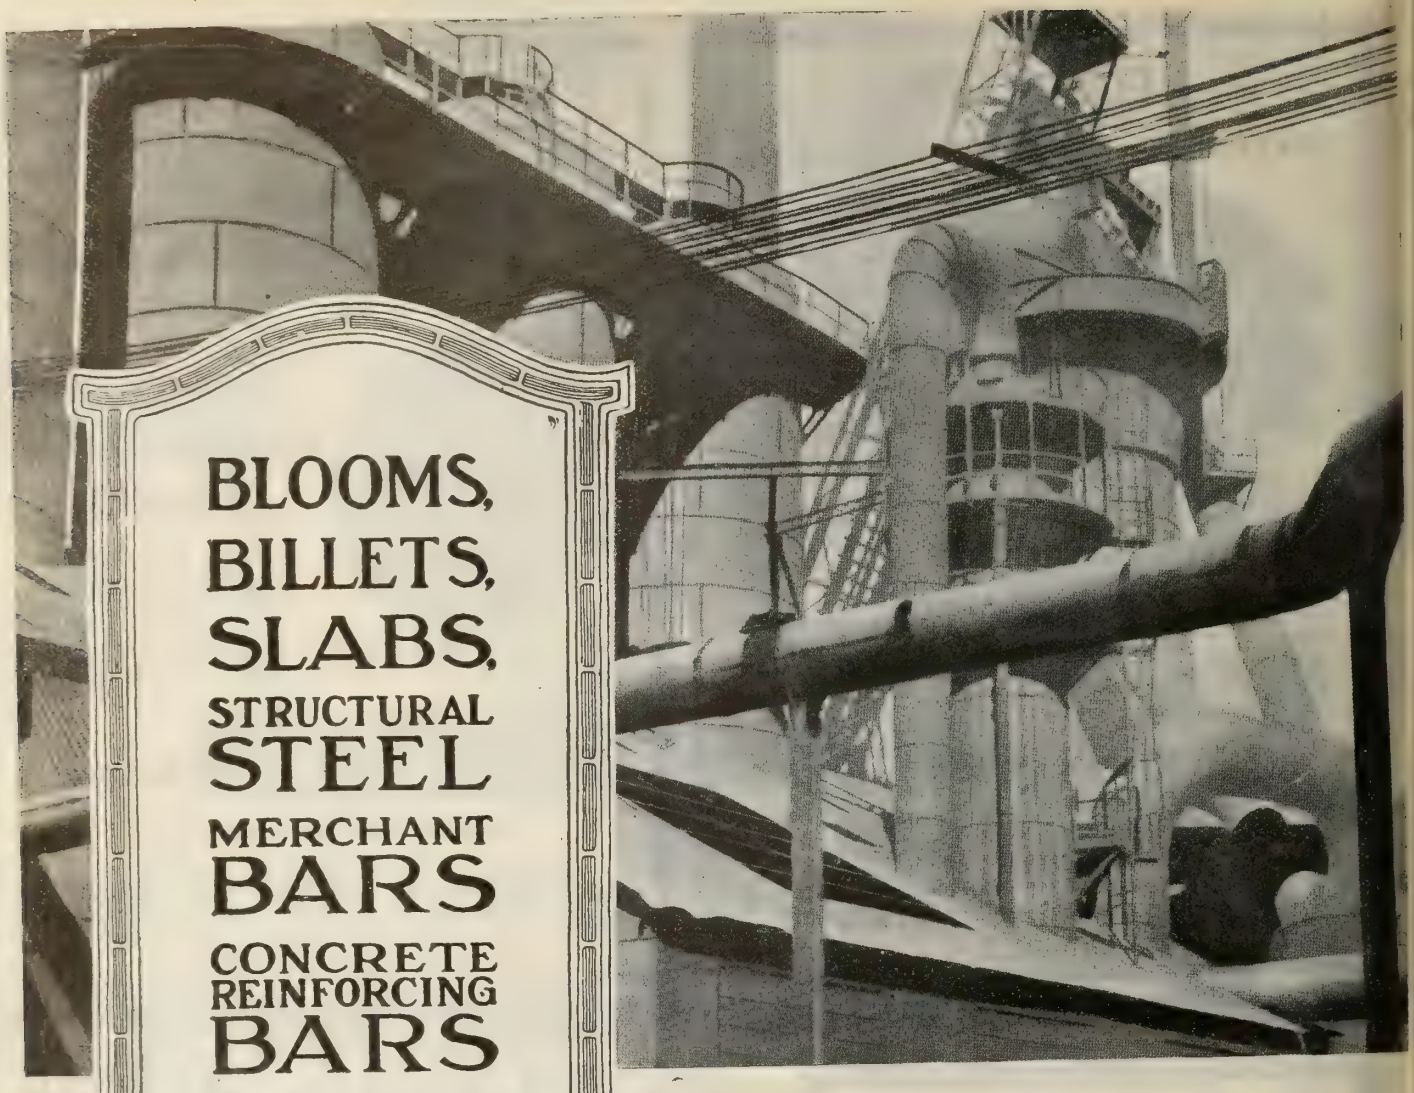
LANDIS

NO. 4-A SPECIAL GRINDING MACHINE



Thousands of grinding jobs are going begging in the automotive repair fields to-day—simply because repair men are not catering to the demand.

Ground parts give real service. The car owner gets full value and the shortened time on the repair work gives a quick delivery of his car for which service he willingly pays.

A Landis No. 4-A Special Grinding Machine is daily earning big returns in a great many repair shops and garages and with even a small amount of repair work, a Landis gives you a good profit. The machine is particularly adapted for all classes of repair work such as regrinding crankshafts, pistons, piston pins, valves, transmission gears, in fact any repair job for automotive engines.

Let us send you complete detailed information.

AN IMPORTANT QUESTION

For the Advertiser to Answer

Is the Publication Soliciting Your Business a Member of the Canadian National Newspapers and Periodicals Association?

YOU would never engage a man on an important piece of work until you gained a thorough knowledge of his qualifications. It would not be wise. You first of all require a clear record of his character and ability, in addition to a statement of his aims and aspirations. When you are in possession of this information you have a real basis for judging his fitness to serve you.

It is just as important that you should know the character, ability and aspirations of the publication in which you desire to carry your business message.

You should know if the paper is circulating and has an influence among those men who are responsible for results—the men who buy, or influence the buying, of machinery, tools, power and any other equipment or merchandise which you may sell.

Facts are essential. When you are in possession of the facts you can make every dollar spent for advertising a judicious investment. To enable the advertiser to make such judicious investment is the purpose of Canadian National Newspapers and Periodicals Association. From this Association the advertiser may secure complete information concerning the character and aims of the leading Canadian publications. The facts are fully presented for your consideration—and they are presented RIGHT.

THE JOHNSON FRICTION CLUTCH

The Bertram Crank Shaper is started and stopped with a Johnson Clutch

John Bertram & Sons, Ltd., Dundas, Ontario, are building a shaper that is designed *right* from the practical standpoint of the user. Countershaft and tight and loose pulleys have been abolished in favor of friction clutch control—control that is immediate, and placed right under the operator's hand.

And Bertram has wisely selected the Johnson Clutch.

On a shaper, especially, convenient control is a valuable feature. But a good clutch is an essential on any machine —and there is none that will equal the Johnson.

Clean Gasoline—Easily Available

Write for Illustrated Booklet C-13

The gradual return to 100% production and the change from a seller's to a buyer's market demands that manufacturers reduce their overhead to a minimum.

An important step in this direction is the installation in your plant of Bowser Piston-Type Measuring Pumps for storing and handling gasoline.

Bowser Equipment will save you time and labor by giving you an easily available supply, no matter where the gasoline is needed. Bowser Pumps guarantee to manufacturers clean, dry gasoline and afford an accurate check on all disbursements. Bowser accuracy eliminates spillage in transfer and the perfected construction makes evaporation impossible.

There is a Bowser Piston-Type Measuring Pump to meet your every requirement.

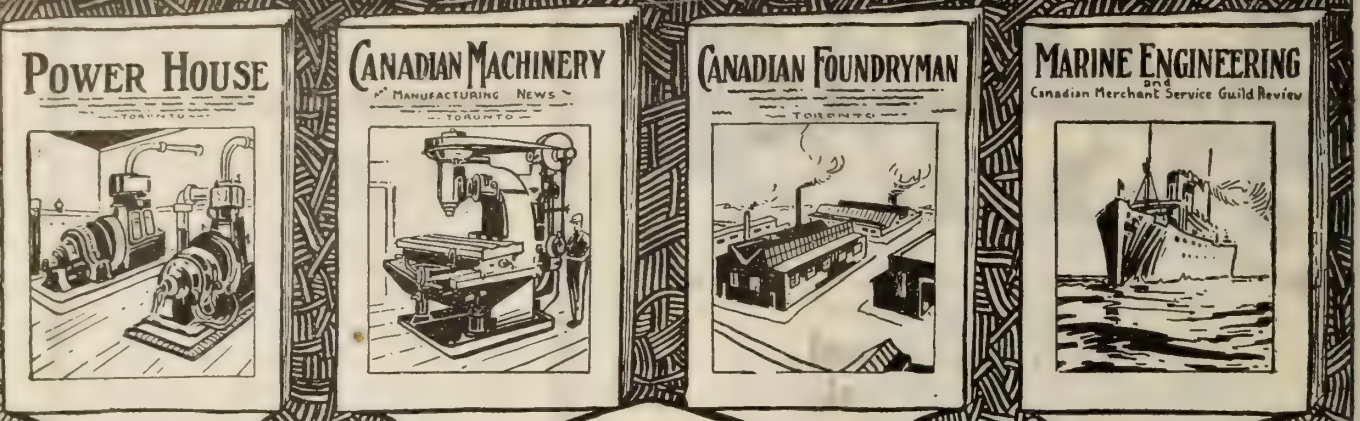
Pulleys that Transmit Maximum Power



"AMERICAN" Pulleys transmit maximum power because their co-efficient of friction is high. Carefully balanced, they prevent vibration. Light in weight, they reduce friction on the bearings and increase the available power for production. Stronger than cast iron or wood, they are more durable and stand shock and overload better.

A booklet, "Getting Maximum Pulley Efficiency," shows in detail just how much such points can really amount to, and will be sent upon receipt of your address.

For

Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working —marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month—$2.00 per year.
Serves the power plant engineer—Steam, Electric, Refrigeration, Hydraulic.

CANADIAN MACHINERY

Weekly—$4.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$2.00 per year.
A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broadest sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)

INCREASE THE CAPACITY OF YOUR MERCHANT

There are two kinds of business policies of the merchandising field to-day.

The first believes the goods are sold when they have been sold to the merchant. Having bought the goods it is up to him to sell them and to get rid of them the best way he can.

The other thinks of merchants in terms of their capacity to sell his goods to the ultimate consumer, and having sold them to keep them sold and keep them coming back for more. The former very often finds new competitors coming into the field, and taking away a great deal of the business he has come to expect should be his.

The second approaches his merchant on a man to man basis. He encourages him to build. He shows him clearly and carefully what he is doing to help him create a market for the products he is distributing. Through the business newspapers the merchant reads, he shows him the turnover possibilities in his line. In fact, he shows him how to make more money for himself, and incidentally make more for the wholesaler or manufacturer.

The second and most successful type of business realizes that training does not stop when he has trained and sold his own selling force on the goods he is merchandising. He realizes that this is only a beginning, that the great force of retail merchants who finally dispose of his goods to the ultimate consumer must be trained, must have knowledge, must have information, so they in turn can prove and sell the ultimate consumer.

The one great way to reach the merchants who are selling your goods is through the MacLean Trade newspapers, which merchants are reading every day and every week of the business year. They are reading them for new ideas, methods, for merchandising plans, for schemes to make more money. Now as never before they are studying the market pages and price quotations of every issue. Firms who are taking advantage of this avenue to better business are finding results far in advance of their expectations.

U. S. ELECTRIC
Drills and Grinders
Can be Attached to any Lamp Socket

For drilling in metal these drills are the superior of every other kind of portable drill. Their operating cost is only half that of air drills. And they can be attached to any lamp socket.

A trial will prove that our drills and grinders will save you time, labor, and expense. Order a few to-day

Made in several sizes from 3 16″ to 1¼″. Motors wound for alternating or direct current or both, 110 or 220 volts.

Various Jigs Used in Making Marine Engines

Milling, Drilling and Boring Operations on Cylinders—Machining Top Pads and Intake Ports—Drilling Valve Stem Holes—Drilling Exhaust and Intake Manifold Flanges.

By ROBERT MAWSON

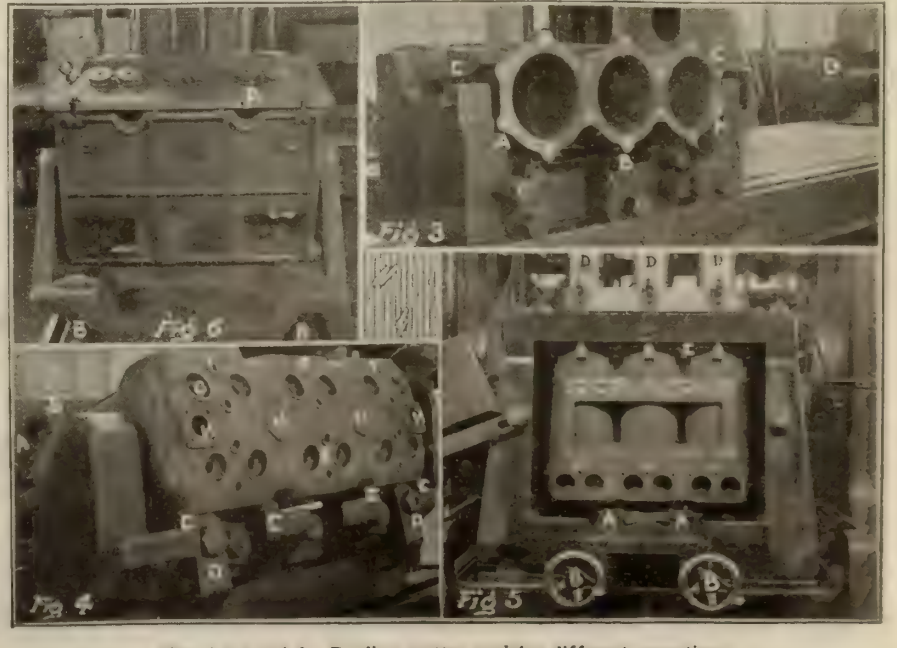
THE manufacture of marine engines entails considerable organization work before they can be made at a productive rate. Without going into the preliminary work involved, we shall discuss some of the fixtures used in manufacturing a 4 cycle vertical six cylinder marine engine, having a 6¼ in. bore and a 7¾ in stroke, and developing a horse power of 250 at 1500 r.p.m.

Milling Operations

Fig. 3 shows the set up for one of the milling operations. The casting is pushed back into the fixture against a stop at the rear, and rests on the height locating pins A. The screw poppet B is raised against the surface shown, this holding the casting against machining stresses. The straps C hold the cylinder in place. The base of casting is machined with inserted cutter D, and the exhaust ports and water jacket flange milled with another cutter E, also of the inserted blade type. Both faces are milled at one time, and once the cutters are set correctly, all cylinders machined will have their machined surfaces in the same relative position, as the locating medium is a fixed surface.

Fig. 4 illustrates the next milling operation, this being the machining of top pads and intake ports, also water jacket flange.

The casting is placed on machined base of fixture, resting on steel pads at A, being fastened down by means of hook bolts, one of which may be seen at B. The edge of the casting rests on pads C, and two tapered straps D are tightened to hold the cylinder securely against the machining stresses. It will be noticed that fixture is made on an angle, the purpose of this being that the pads on the top along line E, will be in a vertical plane.



The inserted cutter for machining water jacket flange at F is placed on an angle so that the surface milled will be horizontal in relation to the cylinder bores. The reason for this may be noted by referring to the design of the milling fixture. The pads along line E are also machined at the same time with another inserted tooth cutter, correctly set to obtain the proper position on the cylinder.

The casting is then reversed and the edge at F placed in contact with stops C, being held in a manner similar to that already described. The pads along the line G are now machined, these being in a vertical plane owing to the angular design of the fixture. The pads at H are machined in a separate operation, the cylinder being placed on its machined base. As these pads are in a similar plane to the base no special fixture is necessary.

The operation of boring the cylinder is shown in Fig. 5. The casting is placed on steel ways A, being pushed back against a stop at rear of fixture. The two hand wheels B are then operated which raise the ways, and also the cylinder, until two dowels enter holes in the base which have been previously drilled and reamed. The three cutter heads are now fed down, and the holes bored to 6¼ inches.

The jig used when drilling the valve stem holes in cylinder is illustrated in Fig. 6. The casting is placed as shown, being located by means of two dowels that fit into holes previously drilled and reamed in the base flange. The casting is then fastened in the jig with straps to hold it securely, and the cover A placed in position, this being fastened with the swinging bolts shown. The fixture is oscillated over to one of the angular positions, as the holes to be drilled are at an angle, as may be noted by referring to the design of the cylinder.

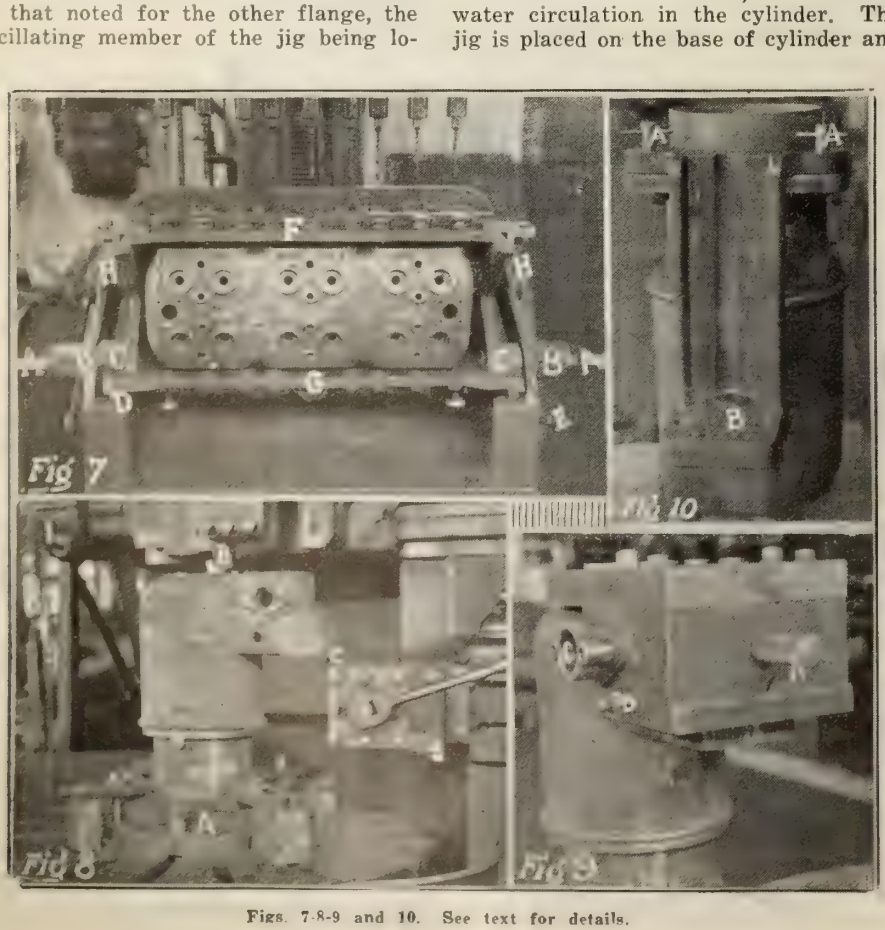
Six holes are drilled and reamed to ⅝ inch. The oscillating member of jig is then placed into the other setting; another jig plate substituted; then six more holes drilled, these being of the same size already noted. An interesting feature of this jig is the provision made

Figs. 3-4-5 and 6. Reading matter explains different operations.

to slide it back for the drilling, circular tracks B being attached to the base of fixture and rollers fitted to jig so that the fixture may be conveyed backward and forward with the least friction and energy on the part of operator. Various stops and screws are used to fasten against casting thus assisting in holding it against the machining stresses. These may be observed by referring to the illustration.

Fig. 7 shows the jig used to drill the exhaust and intake manifold flanges on cylinder. The casting is located by means of two dowels which fit into reamed holes in the base of the cylinder, similar to the last jig. Straps are then tightened to this, holding the piece securely in the jig. The casting and tool are then placed into position shown, being located with the latches A, which are provided with machined stems that fit into steel bushings in bosses B of the main jig, also in steel bushings in the bosses C of the oscillating member of the tool. Steel plungers D operated with knob screws E then brought against the surface of the sliding member of the jig in order to hold it securely with the locating latch pins in position. The exhaust manifold flange holes are then machined, the drills being guided through the steel bushings in the horizontal member F of the jig.

The locating latches are now withdrawn and the oscillating member of the jig swung around 180 degrees, when the surface F will be at the lower side, or where the wall G is shown in the illustration. The intake manifold flange is then machined in a similar manner to that noted for the other flange, the oscillating member of the jig being located and held by means of the latch-pins which fit into the bushings in b sses H and C.



Machining Cylinders

Fig. 8 shows the machining of top of cylinder, and under surface of intake and exhaust port flange on a vertical turret lathe. The casting is located on machine by means of plate A, which is provided with a machined register that fits the inside bore of the cylinder, this having been previously machined.

The casting is then held down on the register plate, also the machine table, with the four clamps as shown. The top of cylinder is turned with tool B, and the under surface of intake and exhaust port flange machined with tool C, each turning tool being held in tool posts of machine in the usual manner.

The jig at Fig. 9 is used when drilling the various holes on upper end of the cylinder. The tool is placed onto the casting and located with the knurled handle pin A, this fitting into a cored hole in the cylinder. A screw at the rear is afterwards tightened, this action forcing the jig back against fixed stop B. The cylinder and jig is then placed on its side and a 1¾ inch hole drilled and reamed through bushing C. Holes are also drilled through the small bushings on each side of C, the latter holes being afterwards tapped ½ inch. The jig and casting is then paced in position illustrated and six 3-8, four 7-16 and one 11-16 inch holes machined, bushings being provided to guide the drills. Fig. 10 shows jig used when drilling holes for the exhaust manifold, also for the water circulation in the cylinder. The jig is placed on the base of cylinder and located by means of two pins A, which fit into reamed holes previously machined. With the tool in position shown five 5-16 inch holes are drilled for the water circulation, and two 17-32 inch holes for the exhaust manifold.

Many other fixtures of interest are needed to complete these engines, but sufficient have been shown for the present.

Figs. 7-8-9 and 10. See text for details.

ELECTRIC COOKING ON RAILWAY TRAINS

There was inaugurated recently on one of England's main lines a unique service, that of electric cooking for the dining cars. The train thus unusually equipped possesses many exceptional features. It consists of five coaches which are run on six bogies only, these bogies being placed underneath the junction of two carriages, thus linking up the carriages on what is kn wn as the articulated system. This arrangement gives very easy running and makes it possible to shorten the connections between the carriages. In the kitchen all the cooking is done electrically. The equipment includes a water boiler, a grill, a steaming oven, a roasting oven, vegetable boilers, steaming pans, hot plates, hot cupboards, fish fryers, kettles, etc. This kitchen is capable of furnishing meals for 78 persons at one sitting, and over one hundred dinners have been cooked and served on one trip. The electrical energy for the cookers is obtained from two dynamos driven through belts from the axles of the carriage. These generators work in conjunction with a battery of 80 cells, carried in boxes below the under frames. In addition to the cooking apparatus, there is a hot water tank of 44 gallons capacity, which is heated up at terminal stations by connecting with the station electricity supply. The apparatus, which has been in service for some time, has been giving complete satisfaction.

GREASING DEVICE

A British firm has brought out a device which makes the grease filling on motor cars a simple, clean process, or at least as clean as it possibly can be. The device is fitted to the tin containing the lubricant, and has a screw with a nut which takes the form of a leather-packed piston of the diameter of the tin.

As the handle attached to the device is turned, this piston is forced down upon the grease, which is thus squeezed out of a hole in the bottom of the tin into the base of the device. From this, in turn, it emerges through a spout from which syringes, lubricators, etc., can be filled. In addition to avoiding the soiling of hands, this simple invention has the advantage of keeping the grease free from grit and dust which gathers in tins which have to be frequently opened.

Handling Material by Compressed Air

A Considerable Amount of Time is Wasted Each Day in Industrial Plants—This Condition Can be Largely Overcome by Up-to-date Lifting Machinery Being Installed.

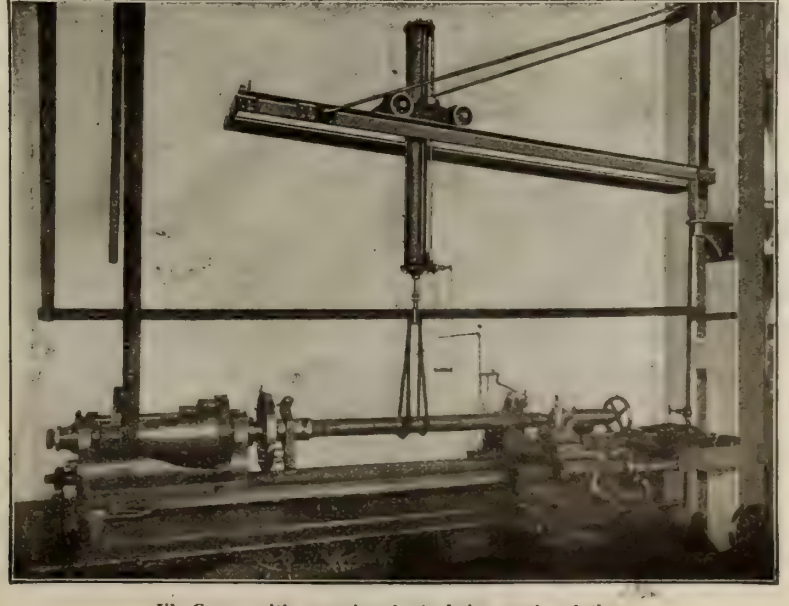
By F. A. McLEAN

THE PROCESS of handling and placing material is one of the greatest time killers in a modern industrial plant, and in most cases it is a condition that is easily remedied. Each time an employee calls a fellow workman away from his machine, bench or task, to help him in lifting or placing material, the firm who employs them is losing money. By the use of proper hoisting and lifting appliances it is possible to overcome this waste and keep the men at work on the tasks which they are paid to do. Hand operated chain hoists, while of considerable assistance in doing away with this trouble, are not always desirable for the reason that no matter how easy it may be to operate them, they are dependent on human energy for their power, and as the day progresses, the workman through fatigue is not able to work at as high speed as he did in the earlier hours of the day, and with some of the cheaper hoists there is the possibility of the man straining himself by trying to raise too heavy a load.

The use of a power operated hoist enables the workman to maintain the same speed throughout the day, so that the matter rests on the selecting of the type of hoist best suited for the work to be done. Steam hoists due to their bulk are out of the question for interior use, so that a choice must be made between compressed air and electric hoists.

Pneumatic hoists may be divided into two general classes, the direct acting or straight lift type in which the load is raised by air under pressure acting directly on a piston with rod and hook to which the load is attached, and the rotary geared motor driven types in which a number of reciprocating cylinders and pistons, an engine of the square piston type, or a motor containing vanes or blades is used to transmit a rotary motion to the hoisting drum. Hoists of the motor driven types are capable of much longer lifts than the straight lift types and require less head room.

A direct lift hoist of the air balanced type



The straight lift air hoist is probably the simplest and cheapest type obtainable, consisting essentially of a cylinder containing a single acting piston and rod which passes through a stuffing box in the lower cylinder head and terminates in a hook to which the load is attached. The valve which controls the admission of air to the under side of the piston is operated by a double-ended lever to which pendent cords or chains are attached. In the earlier forms of direct lift hoist, dirt and moisture were sometimes drawn into the upper part of the cylinder from the atmosphere by the suction created by the down stroke of the piston, thus limiting the usefulness of the hoist in dusty places or where the air was laden with chemical fumes. This trouble was overcome by different makers in various ways and the modern direct lift air hoist is practically a reciprocating air motor well adapted to use in industrial plants of all descriptions.

Single Acting Air Hoists

In the single acting type, the exhaust of air passes from the lower, to the upper part of the cylinder and live air is used only on the lifting stroke. To raise the hook, the admission valve is opened and the air passes from the receiver to the lower part of the cylinder, raising the piston. When the load has reached the desired height the cord is released, the admission valve closes, and the load remains stationary. To lower the load, the exhaust valve is opened by pulling the other cord which allows the air to pass from the lower part of the cylinder through the exhaust valve into the upper part of the cylinder. As the air is thus exhausted to the upper part of the cylinder, the piston and load descend by their own weight. On the next upward stroke the air above the piston is exhausted into the atmosphere. This style of hoist is suitable for use in places where a quick acting type is required, such as in lifting machinery, operating elevators or furnace doors, hoisting castings and in stores and shipping roms for handling supplies and finished products.

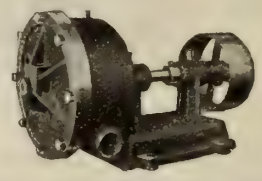
The air balanced hoist differs from the single acting type principally in the construction of the valve mechanism, which is similar with the exception of a third cylinder which acts as a check valve and holds the load from falling in case the hose becomes detached, bursts, or if for any other reason the air pressure is suddenly cut off. In this type the lower part of the cylinder is always open to the air pressure which passes

*Author is connected with the Canadian Ingersoll Rand Co., at Sherbrooke, Quebec.

Jib Crane with trunnioned air hoist serving lathe.

through the check valve before entering the cylinder. To lower the hook the air is admitted to the upper part of the cylinder and allowing the piston and load to fall by their own weight with the assistance of the unbalanced pressure on the upper part of the piston. To raise the hook, the air in the upper part of the cylinder is allowed to exhaust into the atmosphere, and the piston is raised by the air pressure below.

Any possible leakage which may occur around the piston will have no effect on the height of the load as it will be automatically compensated for by the air in the receiver. The pressure above and below the piston keeps the load absolutely steady, there being no sudden movement, or jerking of the piston, and the load is lowered quickly owing to the unbalanced pressure on the piston when the exhaust valve is opened. The steadiness and accuracy of control of this hoist make it suitable for use in such work as may be handled by the single acting type, and in addition, it may be used in placing parts of machinery, in erecting and repair work, handling jigs, serving machine tools, drawing patterns, etc., as the load may be raised or lowered a fraction of an inch at a time and placed with precision, as there is no fluctuation of the piston.



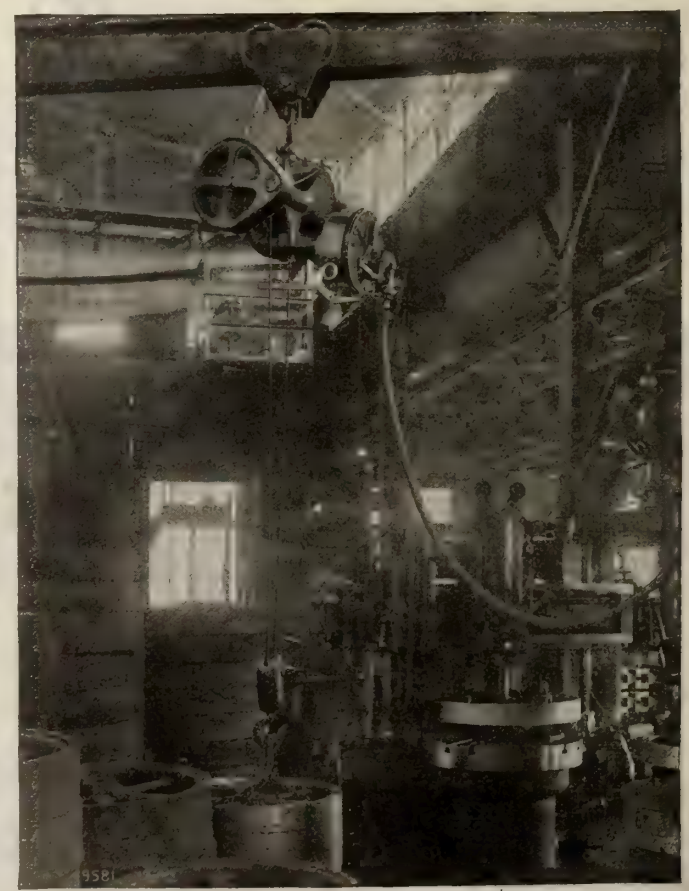
An unique check valve used on this hoist allows the load to be raised, after which the hose may be disconnected and the hoist moved rapidly on a trolley to another part of the mill and the load lowered into the place desired, without the slightest lowering of the load during transit. The valve is easily adjusted and affords a wide range of speeds. As no air is drawn in from the outside in either the class A or B hoist during operation, there is no chance for moisture or dust to enter and their use is permissible in places where dust or strong chemical fumes abound which would prohibit the use of the old-fashioned type.

Capacities of Straight Lift Hoists

Obviously the capacity of a given hoist will depend on the air pressure on which it is operated and the following table shows the lifting capacity of seven standard sizes of Hoists at various air pressures:

Diam. in Inches	For Shortest Length over all Add to Lift 60 Ft.	Capacity in Pounds Air Pressure Ins.	80	100
3	1-2	360	480	600
4	1-2	640	850	1070
5	1-5	1000	1360	1670
6	1-6	1450	1920	2400
8	1-4¼	2560	3400	4300
10	1-8⅞	4000	5350	6700
12	1-11⅛	5750	7700	9600

A disadvantage of the direct lift hoist is the head room required, and to overcome this difficulty and render it possible to secure the benefit of the economies offered by this type of hoist, it is often possible to place the cylinder in a horizontal position, and use a rope or chain to get a vertical lift. When used in this way it is possible to secure a double lift without increasing the length of the piston stroke, and as the high air pressure used for hoisting acts only in the upper part of the cylinder

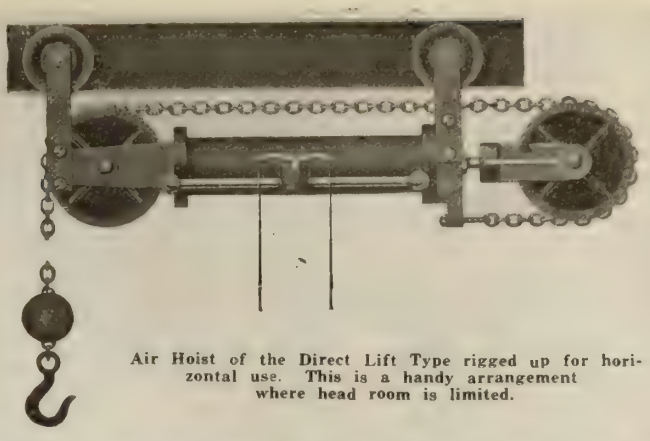


This type of air motor is often used for powerizing cranes, tumbling barrels, etc.

and hence not on the stuffing box, the likelihood of stuffing box leakages is done away with. A double-acting type must be used in order to force the piston back to the head of the cylinder when there is no load on the hoist, but as the pressure required to do this is slight, there will be very little strain on the stuffing box.

The mobility of the straight lift air hoist is somewhat limited by the length of its hose, which may also be said of the small electric hoists which do not

An Air-Operated Jib Crane Used For Unloading Waggons, Cars, etc.



Showing How Air Motor Hoists Can Be Depended Upon For Quick Handling of Material.

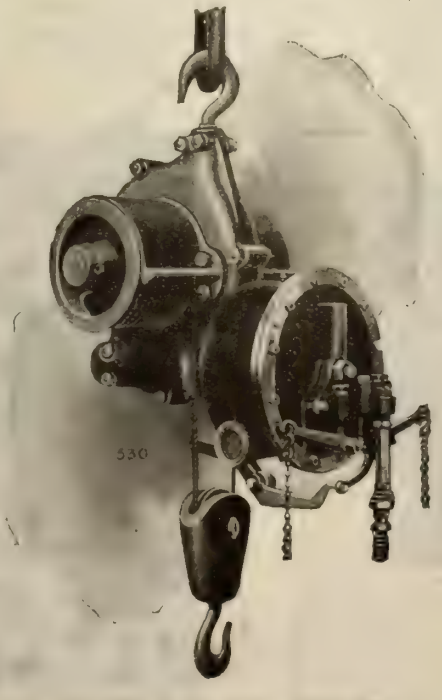
employ trolley wires, but depend on flexible cords for their connection to the power supply. For use on trolleys of medium length and where the lifts are short and frequent, however, it has no equal and will, in many cases, readily save its cost in a very short time.

Cost of Operating Direct Lift Hoists

In commenting on the cost of hoisting with compressed air, Mr. Frank Richards, technical editor of Compressed Air Magazine, estimates that with electricity at 2 cents per k. w. hour and at a gauge pressure of 100 pounds, compressed air costs about 5 cents per 1,000 cubic feet of air, and basing his determinations on this, the rated lifting capacity of various sized straight hoists, their free air consumption per four foot lift at 90 pounds pressure and providing a margin of 30% to cover such contingencies as taking up the slack in the rope, the means of attaching the load, etc., has compiled the following table of costs per 4 foot lift and per 100 4 foot lifts:

Air Hoist of the Direct Lift Type rigged up for horizontal use. This is a handy arrangement where head room is limited.

TABLE OF HOISTING COSTS



Diam. of Cyl.	Effective Area Of Piston	Maximum Weight Lifted	Cu. Ft. of Free Air per 4-ft Lift.	Cost of Air Per lift	Cost of Air per 100 Lifts
3	8.87	618	1-67	$.000084	$.0084
4	12.22	1.099	2-97	.000149	.0149
5	19.09	1.718	4.64	.000232	.0232
6	27.49	2.444	6.68	.000334	.0334
7	37.42	3.367	9.09	.000455	.0455
8	48.87	4.398	11.88	.000594	.0594
9	61.85	5.566	15.03	.000752	.0752
10	76.36	6.872	18.56	.000928	.0928
11	92.39	8.315	22.46	.001123	.1123
12	109.96	9.896	26.73	.001337	.1337

The direct lift hoist being the simplest and earliest type of air hoist developed, is yet more widely used than the improved motor driven type although the latter was designed to overcome some of the objectionable features of the former, such as limited length of lift and the head room required.

The power unit of a well known hoist of this type, is a small three cylinder reciprocating engine or motor similar in design to those used on earlier types of pneumatic drills and reamers. The crank remains stationary and the cylinders revolve around it on a somewhat similar principle to the well known Gnome and Le Rhone engines which have proved so successful in the development of the modern areoplane.

The air admission and exhaust is controlled by ports in the stationary crank shaft, thereby eliminating valves and their necessary gearing.

The motor is geared to the hoisting drum in the small sizes by means of a worm and work wheel; and by the addition of spud gears in the larger sizes. This method of contruction does away with the necessity for brakes to hold the load steadily in any position. The valve is so arranged that it will close automatically when the pendent operating cords are released, and being of the reversing type it readily allows the motor to be run in either direction. An automatic stop is provided which closes the valve when the load has been raised to the maximum height, and prevents the hook from being run up too far, should the operator forget to release the valve cord, which sometimes occurred in the earlier types of hoists with more or less disastrous results.

An Air Hoist of The Motor Driven Type.

The three radial cylinders used in this motor are cast in one piece and revolve about the crank. They are provided with a tapered bronze bushing which is adjusted for wear by simply driving on its larger end. As the thrust of the pistons is always outward and pressure is always exerted between the pistons and the cylinder heads, the cylinders are forced to a tight seat on the crank and leakage of live air is practically impossible, which with the exceptionally short ports used, reduces the air consumption to a minimum. This hoist is provided with phosphor bronze bearings throughout and lubrication is provided for by partially filling the motor casing with oil which is flooded over all of the working parts when the hoist is in operation. As the hoist is provided with an outside exhaust, and there is no air pressure in the casing, there is no tendency for oil to be blown or forced from the casing, drying off the bearings and shortening the life of the hoist. A swivel hook which turns on ball bearings allows the load to be turned in any direction without twisting the hoisting ropes, and to remain in the desired position without swinging back, which is of value when delicate adjustments of the load are desirable.

Operating Costs

One of the principal advantages of this type of hoist is its steadiness in operation and its absolute freedom from vibration, made possible by the balanced motor, which with the worm gear drive transmits a steady motion to the hoisting drum. This results in a uniform lift with no jerks, jars or vibration. These hoists are obtainable in five sizes as shown in the adjoining tables, one of which also shows the approximate operating costs based on air at 5 cents per 1000 cubic feet delivered to the hoists at 80 pounds pressure. This is considered to be a sufficiently conservative figure to allow for any drop in pressure due to transmission losses, and air consumed in taking up slack in the rope before the hoisting actually commences. In many cases this figure would be too high, but these figures may be taken as representing average conditions.

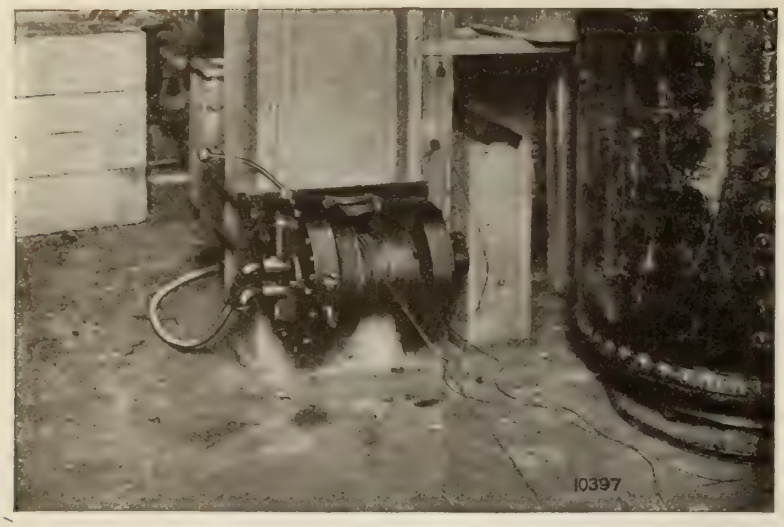


Fig. 6—Showing hoist used for skidding boxes and bales in a warehouse. It is estimated that using this hoist saves the wages of six or eight men.

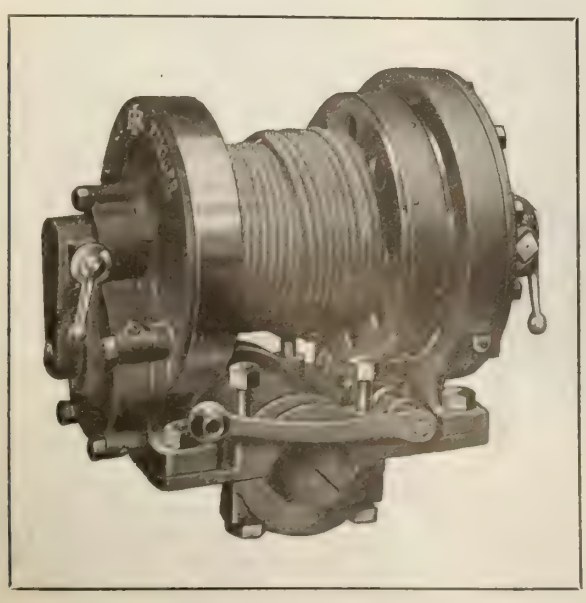
From a glance at this table, it is apparent that a load of one ton, can be lifted to a height of one foot, one hundred times for only one and four tenths cents, or to a height of ten feet, ten times, for the same cost.

to adjust on the machine by block and tackle, for instance: Put on rope 40 secs.; Lift to Radial Drill 28 secs.; Adjust casting on machine 22 secs.; Remove rope and swing away hoist 20 secs. Total 1 min., 5 secs.

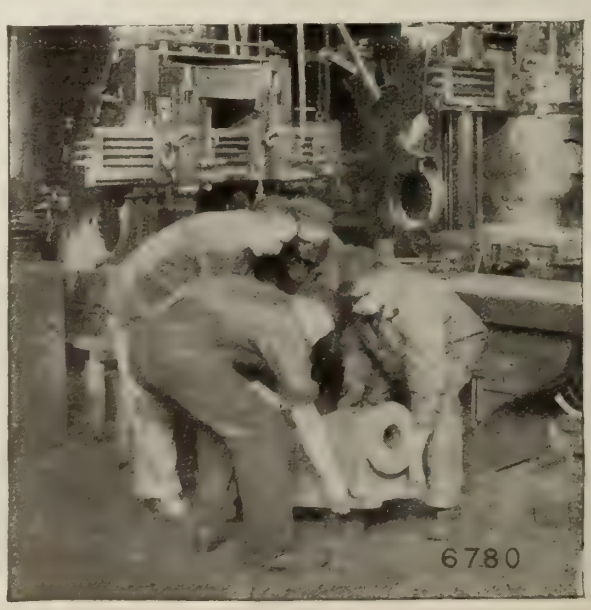
COST OF HOISTING WITH SUCH H)ISTS

Hoist No.	Cu. Ft. Free Air Per Min. at 80 Lbs. Pressure	Cu. Ft. Free Air per foot of lift	Cost of Air Per Foot of Lift	Cost of Air per 100 one ft. Lifts
1	45	1.41	$.00007	$.007
2	45	2.81	.00014	.014
4	45	5.62	.00028	.028
7	80	10.00	.00050	.050
10	80	11.43	.00057	.057



Motor Hoists of the type spoken of above, are particularly well suited to serving machine tools, as the following time study of an actual operation in a large Canadian machine shop will show. The casting in this case weighed about 2000 pounds and would have been slow

The makers of the above mentioned hoist, also make a 2¾ H. P. stationary air motor of the same general construction which may be used to "powerize" existing hand-operated hoists and cranes, or to drive any machinery requiring power within its capacity.



Due to the manner of suspension and their short range, certain types of air hoists are not adapted to pulling up or hauling loads in a horizontal position, and while they are probably the most suitable for general use in the machine shop and industrial plant, and are unexcelled for short straight lifts of not more than twenty feet, and for transferring material from one building to another, etc., there will often occur many situations in which a highly portable hoist of rugged construction and longer lift could be used to better advantage; such as for hoisting ashes in the power plant, switching small cars, snaking or skidding timbers, moving trucks and packages in the warehouse, pulling logs from a log pond or in front of a saw, taking down and erecting piping, shafting, machinery, powerizing derricks and cranes, jib and general hauling and lifting in constructing and maintenance work.

For work of this class a hoist of the type shown at Fig. 6 will often quickly save its cost, as it is light in weight, easily set up and taken down and may be mounted in any position, overhead, on the floor, bolted to a flat timber, or circular column 4½ inches in diameter as may be most convenient. It can be operated by unskilled help and will reduce the cost of many hoisting jobs now being done by hand.

The motive power is provided by an engine of the square piston type, which gives four power impulses per revolution, making the hoist very steady in operation, and as there are no dead centres, it may be started in any position. The engine is readily reversed and is controlled by a small lever on one end of the drum housing. When this lever is pulled forward the load is raised and when it is thrown backward the load is lowered. The reverse may be used as an auxiliary to the regular brake if desired. When the throttle lever is released, it is returned automatically to central position cutting off the air and stopping the hoist. This

Showing brake, clutch and throttle levers of hoist.

This sort of thing wastes time and pays no dividends.

CAPACITIES OF MOTOR HOISTS MENTIONED IN ARTICLE

Size No.	Cap. in lbs.	Ft. lift. per min. 80 lbs. pressure	max. lift feet	Size & Leng. wire rope ins. x ft. &	Size Motor	cu. ft. free air	net wt. lbs	size of hose
1	1000	32	20	¼ x 42′ 10″	4	45	270	¾″

10	80	11.43	.00057	.057

control is very sensitive and the hoisting speed may be varied at will.

Power is transmitted to the drum by means of a clutch and gears, which are controlled by a clutch lever located on the end of the drum housing opposite the throttle. Cords may be attached to the control levers if desired and the hoist operated from a distance. The gears are cut from steel and run in an oil bath which also lubricates the various bearings. The engine is lubricated by oil from a reservoir in the cylinder casting, and the drum bearings are supplied from a large oil cavity in the centre of the drum which only requires an occasional filling.

The brake which is of the band type lined with "Raybestos" is actuated by a long lever attached to the base of the hoist and operates through the medium of a double screw on which are cut right and left hand threads. With this arrangement the brake will stay in any position in which it is put, either on or off, without the use of ratchets or toggles. The brake is adjustable for wear and the brake lever may be placed in the position most convenient for use in cramped or close quarters, for use in which this hoist is particularly suitable, owing to absence of exposed moving parts or projections which might injure the operator. As the drum is mounted independently of the engine shaft, wear and friction from the brake band load are eliminated. A useful feature is the clutch mechanism, as it enables one man to successfully operate the hoist for haulage work, as he can leave the hoist and carry the rope to the desired point, whereas, in hoists not equipped with this clutch, it is necessary to pay the rope out under power, necessitating the services of two men, one to run the hoist and the other to carry the rope.

These hoists are obtainable in two styles for wire or manilla rope and are supplied for operation on either steam or air. Larger valve clearances are allowed and a lubricator and drain cock are supplied when it is desired to operate the hoist on steam. Both styles develop 2½ horse power and the drum capacity runs from 700 feet of ¼ inch or 450 of 5/16 inch wire rope in certain sizes to 300 feet of ⅞ inch manilla rope in the other styles. The lifting capacity varies from 1000 pounds and the other style handles 600 pounds at 85 feet per minute, or smaller leads at higher speeds, on a steam or air pressure of 80 pounds.

There are only 600 working minutes in each 10 hour day and if a man and machine are forced to stand idle for 6 minutes 20 times a day, their efficiency is reduced by 20% through the enforced idleness of the machine. By the proper selection and location of air hoists this loss can be reduced or done away with, floor space otherwise encumbered, kept clear for new work, and the time for passing a job from one stage of production to another materially reduced.

Figured on the basis of cost of installation, maintenance and power consumption, air hoists to my mind cost less per year and will stand up to their original capacity and last as long, or perhaps longer, than any other type of power hoist at present available.

Haulage capacity of hoist shown at Fig. 6 on various inclines.

This table, shown here, is based on 40 pounds per ton rolling friction and also that of the maximum load on hoist, the pull on the rope will be 1000 lbs. and the air or steam pressure 90 to 100 pounds.

Haulage Capacity of Hoist Shown at Fig. 6 On Various Inclines

200 ft.	63 deg.	27 Min.	1.080 Lbs.

A new cable service across the Mediterranean is soon to be established, connecting the ports of Marseille and Philippeville, according to a recent report from Algiers. The entire cost is estimated at 7,280,000 francs, and contains an item of 180,000 francs for equipment. The Algerian budget for 1922 already provides for meeting half the expense of construction.

Problems In Connection with Leather Belting

Technical Research in Leather Belting Industry Has Progressed Rapidly—Many Points Must be Watched—Stretch—Creep—Its Cause—Elasticity—Effect of Humidity—All Are Important.

By J. EDGAR RHOADS

TECHNICAL research for manufacturing industries has grown at an enormous rate within the past decade or two and competent men, capable of investigating in an original way problems bearing on the methods of production, raw materials or properties and uses of finished products, have been in greater call than in former time. Industrial concerns have in many cases attracted specialists from pure research which they were conducting in universities to work upon technical problems.

The policy of some universities and a few other institutions of setting up Fellowships for investigation of problems of a manufacturer or group of manufacturers has much to commend it, and has led to notable improvement, not only in new lines of business, but in some of the old ones. As an instance of this, the baking industry, and the manufacture of various plastics from flour such as macaroni, have after centuries of practical experience learned through careful research some of the fundamentals that have to be followed in order to get the most satisfactory product and in order to save raw material used. As an instance, one of the large baking concerns has found that proper treatment of their water, used in the dough, has resulted in an economy of upwards of one hundred thousand dollars a year. With the water treated in the proper way, less flour is required to give a certain yield of bread.

The Mazda lamp is a splendid illustration of a great national economy, resulting from careful search for a more satisfactory form of filament than the old carbon one. The electric companies have been spending tens of thousands of dollars per annum in research departments devoted to improving product usually in a way to actually save money for their customers. It is important, of course, that all of this work should not entirely supersede the pure research of the scientest in the university, and usually the two branches go hand in hand and probably this will be found to be more true in the future than in the past.

As the coal reserves of the world have become reduced through extensive mining operations, engineers have found out how to make coal go much further than they ever did before, through improved control of combustion, more efficient boilers, protection of heat value in the form of steam through insulation and super-heating and other economies resulting from recovery and use of exhaust steam. The steam engine itself has been greatly improved until now by the use of the latest forms of uniflow engines, it is possible to get a mechanical horse power with probably less than half as much coal as was required not so many years ago.

*Read before the National Association of Leather Belting Manufacturers, Philadelphia, Pa., November 16th, 1921.

Use Of Roller and Ball Bearings

After the energy has been turned into mechanical power, the use of roller and ball-bearings on high speed shafts have reduced friction load and we know that the electrical transmission of power, now soon likely to be possible up to perhaps a million volts, has made practicable the carrying of power in this form for what were unheard of distances only a short time ago. The tendency towards individual drives upon every machine, however, seems to have been largely or at least somewhat checked, due to the fact that earlier promises of economy have not been entirely lived up to by experience, and the group system of driving with belts and counter shafts over a comparatively small area seems likely to become more generally adopted, which of course, tends to lessen the number of large belts in use in proportion to power transmitted.

The use of leather belting for power transmission has been common for decades, but until very recent times, comparatively little has been done in the way of a scientific investigation of it. Possibly because as a method it is so exceedingly simple and efficient. Even within perhaps twenty years, the millwright was supreme in this work and the trained mechanical engineer had given little thought to the matter. The latter was perhaps loath to undertake careful investigation of the subject as a comparatively superficial investigation showed that there were many and rather serious complications involved in making scientific tests in the various factors which go to make up belt drives, and some of these factors were quite difficult to control. No methods of investigation of accurate measurement had as yet been worked out, in fact, a few of the points involved as yet are almost untouched. It is one of those cases where it is important to really begin at the bottom and make a thorough study, if reliable conclusions are to be reached. The fact that many of the earlier investigators ignored some of the important factors, has led their successors into great trouble and mistakes. This situation, however, should not cause us to hesitate in carefully investigating the scientific side of our industry with an idea of putting it upon a really solid engineering basis and giving us the feeling that we have scientific knowledge comparable with that existing in some other lines of highly developed manufacturing work. Let us consider some of the items which are involved in such a study.

Common Causes of Trouble

The experienced belt-maker would probably say that the two most frequent sources of trouble are belts stretching and running crooked, the latter usually with high speed drives where single belts are most likely to be used. It is evident that there are a number of things which may affect the stretch of a belt, such as the kind of hide used, tannage, method of currying—that is, the percentage and distribution of grease in the leather itself, and the thoroughness of stretching given to the leather before it is made into a belt. The hide of spongy fibre or consistency is likely to make leather that is more stretchy. It is well-known that certain tannages, probably those which do not well fill the inter-fibular spaces, make leather which is made more apt to stretch than that which is dead tanned. Belts running crooked, when not due to abuse, are certainly sometimes caused by the springing of the piece of leather, after it is stripped to width, which is probably related somewhat to the factors influencing stretch just previously noted. With leather which is not very thoroughly tanned there seems to be a tendency for one edge of the strip to draw up more than the other after it has been stretched, and thereby pulling crooked. Aside from the annoyance to the user by having to frequently tighten the belt, the tendency to stretch causes a rapid reduction in the tension, and unless the co-efficient of friction is unusually good, there results a rapid diminution in the effective tension and the work which the belt will do.

While a moderate amount of stretch is perhaps not a serious matter, the importance of this being removed as soon as possible, so that an effective tension high enough to carry the load satisfactorily may be maintained is of great importance. As far back as the days of Frederick Taylor considerable work was done in determining what was the proper tension to install a belt. He arrived at figures which were certainly conservative and practicable. I think there is not much doubt that if the belt users of the country had been willing to adopt his recommendations in this respect, they would have had greater economy with belting than has been the case. However, the tendency has been to load closer to limit and to settle upon a tension which could be maintained steadily, but which would give a maximum of power transmission. It would not be surprising to see higher tensions still

adopted with improved methods of manufacture and better types of bearings.

Closely allied with the question of stretch is that of creep and its cause, and elasticity, which we have for a long time thought one of the most valuable properties of the leather belt, and one which differentiated it sharply from most of the substitutes available. Some of the work on this has been done by Mr. Jones and Professor Sawdon, which has thrown rather more light on earlier work and theories in connection with the subject. They have shown that the leather belt is not perfectly elastic in that it comes back immediately after the removal of tension, but that there is a time lag which may have some bearing upon the problem of transmission of power. Just what this is will probably vary a little with different leathers, but from the practical standpoint of power transmission it seems pretty clear that it will account for perhaps the first three quarters of one per cent. or one per cent. of what we read as slip in our power transmission curves, and it would seem reasonable that there is room for further improvement in reducing this a little more in a way which will increase slightly the efficiency of the leather belt.

The Wide Variation

The wide variation in the observed co-efficient of friction readings on a belt when it is just new and that obtained after it has been in use some time shows clearly the importance of a proper finish on the surface. One interesting feature which had not been carefully studied until perhaps of recent times is in the observation that the co-efficient of friction changes quite noticeably at different speeds of slip on a given piece of leather, though the coefficient of friction does not apparently change in any considerable way at different tensions. It is obvious that in a running belt the effective tension, which is the difference between the tension on the tight side and the slack side, is limited very definitely by the co-efficient of friction obtained at a given speed of operation and of slip. This problem seems to be one of the very fertile fields for further work.

So far I have not mentioned the often spoken of factor of tensile strength, though it is apt to be one of the main things alluded to in leather belting specifications. I have not mentioned it because the factor of safety in a good leather belt is high, often "5 to 1" to "10 to 1", and it is a very rare thing to hear of a belt tearing because of the load applied to it unless some accident has occurred.

Another very important factor in the capacity of a given belt to transmit power is speed, and while considerable work has been done on this subject, there is still a good deal to learn. It has only been a few years since a prominent leather belting manufacturer stated that he considered it good practice to run leather belts for woodworking machinery at speeds in the neighborhood of 9000 ft. per minute. Other makers disagree with him. Dr. E. D. Wilson, in presenting data on the subject published in 1919, (and on which the tables published are based) has shown that at this speed a double belt will transmit practically no power and a single very little indeed.

There is no available machinery for actually making such tests at these high speeds, and general experience in which little scientific data is available seems to indicate that the greatest efficiency is obtained at speeds of 4000 to 5000 ft. per minute. So far as I am aware, none of the data submitted take into consideration the effect of grease, and of the varying coefficients of friction at the high speed of slip which would be obtained at any such speed as 9000 ft. per minute. We do know, of course that the centrifugal force increases very fast on higher speeds, tending to throw the belts away from the pulleys, and it is likely that scientific work on this subject when it is done thoroughly, will, as is so often the case, bear out practical shop experience, at least in large measure, and recommend the limitation of speed to a more reasonable figure.

Humidity And Its Effect

Some years ago the subject of humidity and its effect upon leather belts was investigated, but whether or not due consideration was given to the variation in the modern methods of currying from the old hand stuffing, and whether the tests were made on a large number of belts, or only on a few of one make, I am not aware. It does seem, however, pretty clear that the presence of large amounts of humidity lower the effectiveness of a leather belt, but it is also likely that proper treatment will do something to lessen this tendency.

During the past few years the use of compressors and machines with a wide variation in loads has rather increased, and motor driven compressors with a binder pulley or tightener have become very much more common. This type of drive has received comparatively little careful investigation, though it has been known to work quite well with proper installation and sufficient belt capacity. It does, however, seem quite clear that it is necessary to have more belt for a load of this kind based upon the power required from the motor than for an ordinary steady pull; some say twice as much is needed, but I believe this is still another subject requiring careful test under well controlled conditions.

Closely allied with this is the question of arc of contact, the effect of increasing or decreasing this in the load which a belt will carry, and also the most effective way to arrange drives where there is a small driver and a large driver or vice versa.

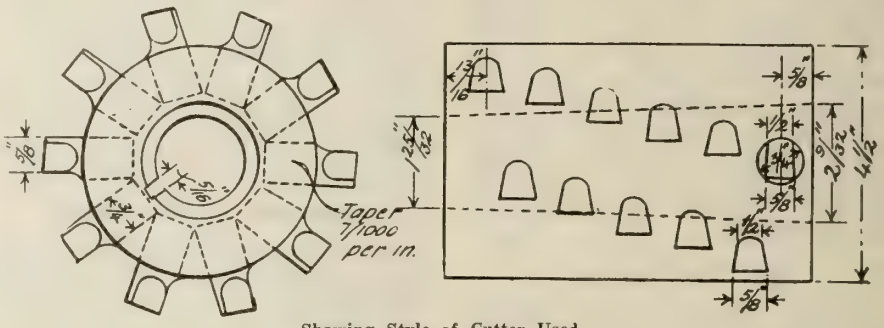
The subject of center distance was investigated somewhat during this past year at Purdue University, but time prevented final or the most thorough kind of test. The mill-wright has known for a long time that increasing the center distance was a great help, and that with a well designed drive, the position of the catenary formed by the slack side on top was a great help in steadying the belt, particularly on sloping drives where belts were running at angles with the floor. Here there are such varieties of conditions available that much work is necessary to get standardized competure worked out. The same would probably be true of quarter and half turned or cross belts, a frequent source of annoyance and trouble to the user. The comparative virtue of drives in which the tight side is on top or on the bottom is a subject of course which ties up closely with that of arc of contact and center distance.

Pliability is another factor of no small importance in drives of this character, and though as yet the scientific investigation of the problem is still ahead of us the best practice is tending away from the heavy, stiff, hard belt toward the lighter and more pliable one. From the above I would not ask any one to think that little work has been done, for really much has been, but there is still a good distance of road to travel. The quite thorough testing that has been done by at least three separate investigators on the comparative power transmission qualities of leather, and most of the principal types of substitute belting, has been of great value to the engineering world and the belt user, and should be a source of great economy.

The very satisfactory way in which these investigators have shown the leather belting superiority, particularly when it comes to carrying over-load or shock-load, should not be under-estimated. During the past few weeks a very careful comparison has been made to settle the much mooted question as to which side of a single belt should run next to the pulley, and Mr. Jones has prepared very complete figures which he is probably just about ready to publish, which represent an enormous amount of careful work and prove conclusively that the grain side of the leather belt is on the average decidedly superior to the flesh, though he has found that some belts, carrying very high amounts of grease, will do nearly as well when run with the flesh side to the pulley as the grain. These, however, are not representative of the great mass of standard leather belts upon the market.

In conclusion, I wish to encourage every manufacturer to consistently and diligently support the idea of research for I believe that the hope of industry is in this line, and that many of the wastes which are charged against industry in all lines will within the next few decades be largely eliminated through the diligent and painstaking care of highly trained scientists and investigators who leave no stone unturned to try to get to the bottom of the problems which affect their subjects.

Effective at once, says a C.P.R. report, Mr. J. Telford is appointed Road master St. John and Fredericton Sub Division with headquarters at McAdam vice Mr. W. H. Noyes, transferred.

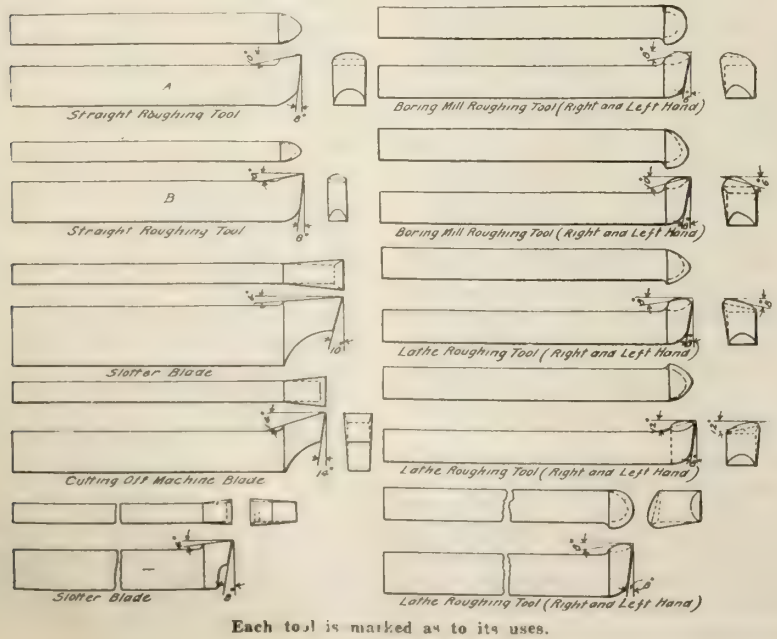


Standard Tool Shapes Have Been Adopted

Various Tools Used for Slotting—Milling—Cutting Off—Boring —Threading—Counterboring—Planing, etc. Standard Shapes Have Proved Efficient—Double Angle Iron Fixture for Planing Crossheads.

THE USE of the tool grinder and of standard cutting tools has become so general in manufacturing establishments where production work is the rule, that it is taken as a matter of course. The practice is growing in railroad shops and the Erie is one among the roads that has adopted the system for the general run of work. It is, of course, impossible to provide a set of standard tools that will meet every possible requirement that may arise, but the standard shapes that have been adopted on the Erie will be found to cover such a wide range of work that the field left open to special tools will be found to be exceedingly small.

Starting with the roughing tools, continues "Railway and Locomotive Engineering," the heavy round-nosed type has been found to be most efficient, and provision is made both in boring mill and lathe work for tools of this type for cutting both cast iron and steel. While the tools for both services fall under the general classification of "round-nosed" there is a marked difference in their shapes as adapted to the boring mill and the lathe. When taken in plain view, the boring mill tool has a rounder form than that of the lathe, whose contour more closely resembles that of a gothic arch. The usual difference in rake and clearance for tools intended for cutting cast iron and steel is noticed in that both the rake and clearance is less for the cast iron cutting than for the steel cutting tools.

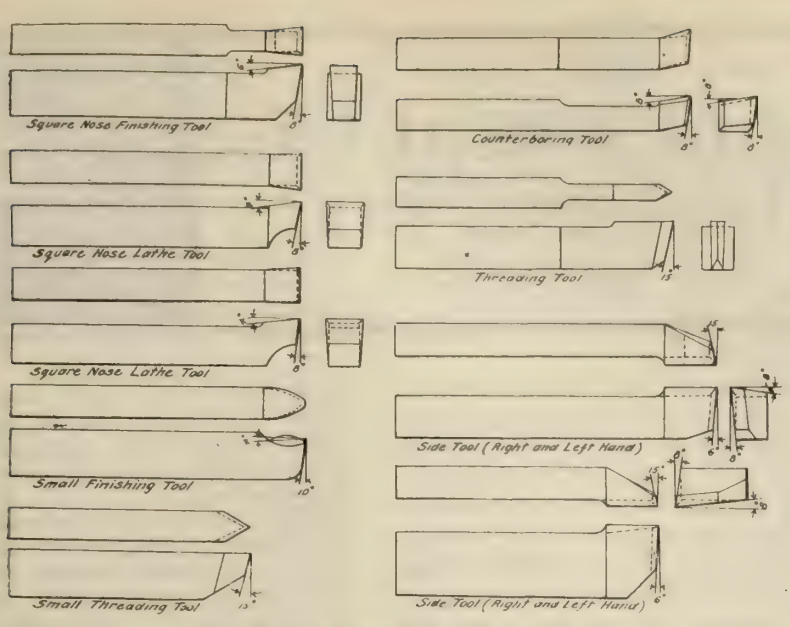


In the case of the boring tool for cast iron the rake is the same (8 deg.) but the clearance is 2 deg. less than for the lathe tool, these being 6 deg. and 8 deg. respectively. But, for cutting steel the rake is 2 deg. less for the boring tool than it is for the lathe tool, the angles being 10 deg. and 12 deg. respectively, while the clearance angle (8 deg.) is the same for both. The side rake for the boring tools is less in both instances than it is for the lathe tool.

Showing Style of Cutter Used.

it being in the steel cutting tool only 5 deg. as against 12 deg. for the lathe. As these angles and shapes have been carefully studied in order to obtain the greatest efficiency of the tool, they are deserving of close attention. This efficiency involves not only the possibility of the maximum speed in the cut but the minimum of cutting resistance and consequent heating of the tool.

All the tools above described have a side rake and are intended for what comes under the general classification of heavy work. But for lighter work roughing in either steel or cast iron but more especially for steel work there are two styles of straight roughing tools in use (A and B.). That is tools with no side rake. The two tools are of practically the same shape, that is, they have the same angles of rake and clearance, to wit: 10 deg. and 8 deg. respectively, and differ only that one is wider than the other and has a front face with a longer radius than the other so that, with the same feed, it will make a smoother cut.



Each tool is marked as to its uses.

Slotter Blades

We next come to the slotter blades of which there are two forms differing only in the weight of the tool and the angle of rake which is 10 deg. and 8 deg. respectively. The heavier tool also has the greater width of cutting face but the angle of flare of the two is about the same.

The cutting off machine blade deserves especial attention because of the large angles of rake and clearance which it offers and the wide angle of flare and wide cutting edge presented to the work. The rake and clearance angles are the same (14 deg.), and in this the practice differs widely from that too often found in the average machine shop, where, for that very reason, cutting off, especially of heavy bars, is a piece of work that is very properly dreaded. Here we are apt to find that an attempt is made to do a cutting off job with a tool that may have no rake at all but be quite flat on the top, while the clearance is made as much as the strength of the tool will allow, so as to provide for the decreasing diameter of the surface that is cut. The result is a chattering tool and an excessive pressure put upon the upper surface by the chip as it curls up from the cutting edge.

With the large angle of rake of 14 deg. in the tool illustrated there is no tendency to chatter and the angle of

Refer to underline under each style of tool.

curl of the chip is so reduced that the pressure on the upper surface of the tool is greatly reduced, and with it, the power required to drive the tool through the metal. There is, on the other hand, a tendency for the tool to spring into the work, when it is raised at such an angle and cut away at the bottom, but this tendency is met by careful feeding so that the tool is held to a constant cut at all times. In this connection it is to be borne in mind that when the tool springs into the cut it turns about the front edge of its support in the tool port, so that, for a given height of cutting edge above that support, the angle at which it springs into the cut is the same regardless of the angle of rake, so that the greater the rake the less the pressure of the chip and the less the tendency to spring into the cut.

The square-nosed tools both for finishing and for lathe work that may require such tools are given a clearance of 8 deg. and a rake of 6 deg. for the finishing tool and 4 deg. for the ordinary square-nose tool. Here again attention is called to both of these points. It is a common practice to make a square-nose tool without any rake and. then, if it scrapes off the metal instead of cutting it, to grind a notch in the top face just back of the cutting edge. This may give a rake of as much as 45 deg. for a short distance when the chip is curved sharply upward. Such a tool will cut well while it lasts but its life is short, because of the rapid wear by grinding. The Erie practice, therefore, of giving all such tools as have thus far been touched upon a long even rake is worthy of attention. Not that it is a novel feature when attention has been paid to such things, but they do not always receive the attention that they ought.

In the case of the tools for cutting V threads attention is called to the wide angle of clearance (15 deg.) that is allowed, and also to the fact that there is an ample side clearance. The front clearance reduces the cutting edge of the tool so that it is a real cutter and not a scraper, and the side clearance leaves a clean thread besides adding to the side cutting qualities of the tool.

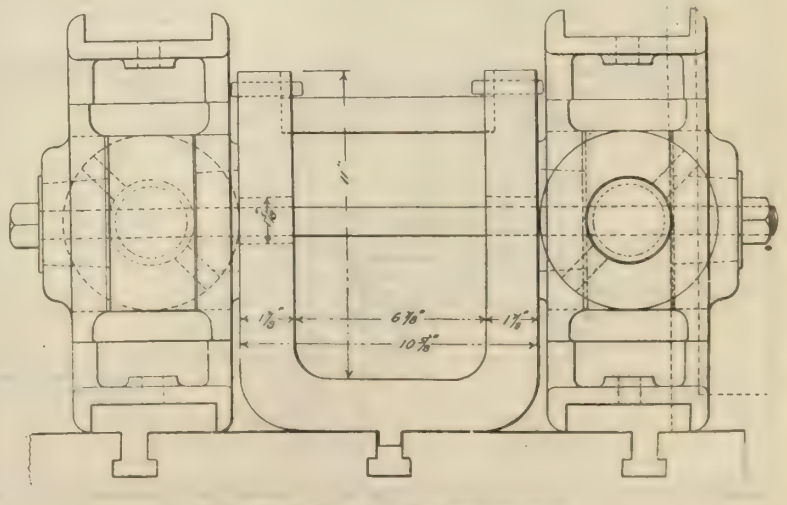
The counter boring tool has an advancing cutting edge that terminates in what closely approaches a point, but has its cutting edge protected by ample side and front clearance and back and side rake, an angle of 8 deg. being used at each of these points, so that the cutting qualities are as good as possible.

The side tools are made on the same general principles as the counter boring tool, but with the variation in shape that their work requires.

Cutter Head for Vertical Miller

The very sturdy cutter head shown in the illustration is used on a vertical miller for a variety of heavy work. It carries 55 cutters set in eleven horizontal planes, with five cutters in each plane, each of whose cutting edges overlap those of the plane above and below. As will be seen from the dimensions the head sets over the tapered end of the spindle and is driven by a 5-16 in. key.

The cutters themselves are of ¾-in. round steel ground to the cutting shape shown in the side elevation, with a cutting face ⅜ in. wide and tapered back with a side clearance to a width of ½ in. at the back. They are turned to fit a tapered hole in the head which has a diameter at the face of ¾ in. and tapers back at the rate of .007 in. per inch of length. Such a cutter is capable of doing very rapid and heavy roughing work.



Wheel Boring Tool

A heavy tool or rather toolholder for boring and chamfering cast iron wheels at one setting is used with considerable success. The body of the tool is made to fit in the tapered hole of the spindle of the wheel borer. Just below the shouder a slot is cut for the reception of the chamfering tool, which, as its work is comparatively light, is held by a setscrew.

Below this the diameter of the body is reduced and it is threaded to take a nut. In the smooth portion below the thread another cross slot is cut for the reception of the roughing and finishing tool. A sleeve is also turned to fit over the smooth portion and it is cut with a slot to match that in the body and drilled on one side to admit a setscrew which is run into the body and serves to put a side pressure on the tool. This tool is slipped through the slots in the body and sleeve and can be held lightly by the setscrew while being adjusted to the proper cutting distances from the center. The setscrew can then be tightened and the nut run down, forcing the top of the slot in the sleeve against the top of the cutting tool which is thus held firmly in place by pressure both at the top and the sides.

At the bottom there is a hollow screw through which a hardened steel stem is passed. This stem has a roughened

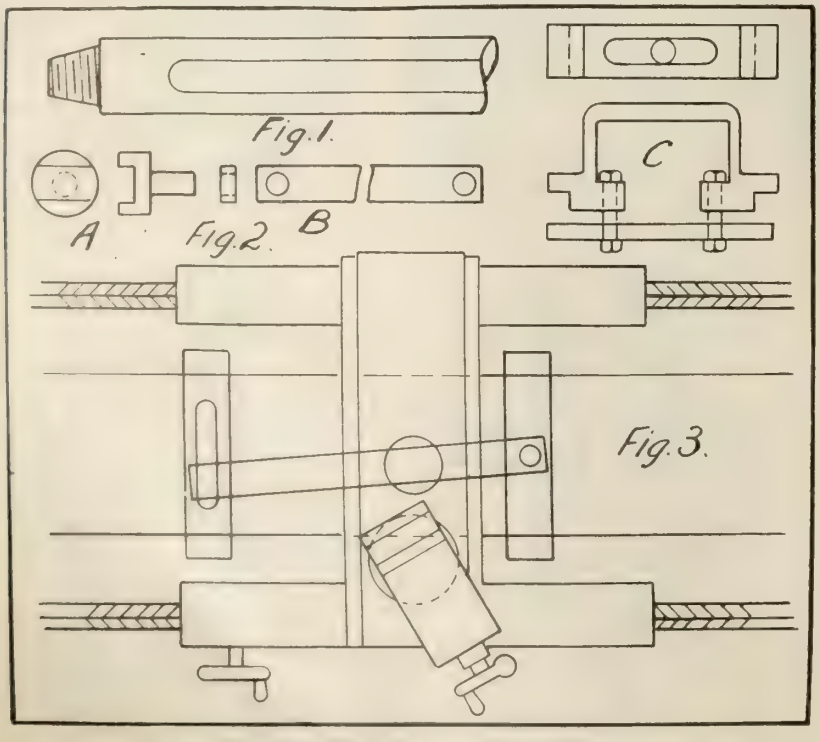
Double Angle Iron for planing crossheads.

WHAT OUR READERS THINK AND DO

RE-THREADING WELL DRILLING SPINDLES

By C. E. W.



We had a number of drill spindles to re-thread, and fit, so in order to make these at least cost, we devised a taper attachment as shown in sketch. It will be seen from Fig. 1, that the thread is cut at a very steep angle, in fact too much for the regular taper attachment.

The threads must be absolutely correct, otherwise there is grave danger of the spindle working loose, and dropping off several thousand feet below the ground level. The drillers sometimes manage to recover such spindles by means of a special fishing tool, but they are occasionally lost and the hole has to be re-drilled.

The portion "A," shown in Fig. 2 represents a plug that was turned from a piece of shaft to fit a hole drilled in the cross feed saddle. The slot in top was cut to a sliding fit on the bar of steel B. Two brackets "C" were cast and machined to fit the lathe bed, one having a hole drilled and tapped about the center, the other having a slot cut in it to allow for adjustment.

In operation the bolts holding the cross-feed-screw nut are removed, leaving the saddle free to move back and forth. The plug "A" is slipped in place. The brackets "C" are placed in position, the slotted one in front and the tapped one in rear of the carriage. The bar "B" is pivoted on a cap bolt on rear bracket, and passing through slot in "A" is held by a clamp bolt which works in slot in forward bracket.

Bar "B" is made long enough to allow for sufficient travel of the carriage. The tool is carried in the compound tool post which is set at an angle of 38 degrees to the thread angle and of course, as the cross-feed is disconnected, all feeding is done by the compound. The assembly is shown at Fig. 3. This device has proven very satisfactory and is capable of being modified by drilling other holes in rear bracket so as to enable it to cut almost any angle.

Showing how well drilling spindles were threaded

CAN YOU ANSWER THESE QUESTIONS?

Judging from the number of replies you received to a recent query in "Canadian Machinery," your readers are certainly interested and willing to exchange ideas. Here are one or two other questions which I would like to see answered:

What is the proper method to cut the threads in the jaws of a universal chuck? Owing to the fact that the jaws come in contact with an ever-changing radius of the scroll as the jaws move up and down, some provision must be made for this. How is it done? I have only seen this job done once, and it was not at all satisfactory.

Some time ago you published an interesting article on the manufacture of steel ball bearings, in which it was stated that the scleroscopic reading for hardness was very erratic and even stated that for a certain size ball the reading was practically the same as it was before the ball was hardened. I got two balls out of the stock room, a large one about 1⅛ and one about ⅜. One tested with the scleroscope about 86 and one about 47. This prompts the question is the sclerescope a reliable hardness test? If those two balls had been ground flat, would the reading have been the same? Were we fooling ourselves when we tested the round surface of small shells with the scleroscope?

Editor's Note:—We will be pleased to pay space rates for any accepted material answering these two questions. Let us hear from you.

CUTTING WORN GEAR BLANKS

During the war it was very difficult to get contracts executed for small jobbing work. Thus, when the writer was presented with a rush job by an old and valued customer it was felt that the work must be undertaken although quite out of the line of work regularly handled. The job consisted of cutting three cast iron single threaded worm gears from the solid blanks which were furnished to the shop fully machined. The worm gears had a pitch line diameter of 28.-966 inches with 52 teeth 1¾ inch circular pitch. The worm was slightly over 5 inches pitch diameter. The face of the worm gears was about 3 inches. The shop was not equipped with any machine tools that were designed to take care of this work. There was not a hob of the required specifications in the shop.

A piece of carbon tool steel 6½ in-

ches in diameter and about ten inches long was located in the stock room. A formed milling cutter the same diameter as the worm was made. The form of the cutter was that of a milling cutter which would be used to cut rack teeth 1¾ inch circular pitch, of the involute tooth design. Then a regular hob was made which was to be used to finish the worm gears. The milling cutter was placed on the spindle of a Universal Radial Drilling machine. The worm gear was placed on a stock shop made dividing head. The swinging radial arm of the drill press was inclined at an angle to give the proper lead to the slots which were to be roughly milled as the first operation in cutting the worm gears. As shown in Fig 1 the dividing head was clamped to the cast iron floor plate. The radial arm was clamped in a position at 90 degrees with the arbor of the dividing head. The milling cutter was fed into the work by hand, using the hand crank on the end of the radial arm to move the head and drilling spindle along the radial arm in a horizontal direction. There was a stop clamped on the arm against which the head moved, and thus a uniform proper depth to the slots was secured.

After the worm gears were thus roughed out, the finishing operations were done on a 30 in. Gap Lathe. This Lathe had a type of saddle which lent itself to this particular job, the design of the tool slide, carriage, etc., being of antique vintage, as shown in Fig. 2.

The hob was keyed on a mandrel which was placed in the centres of the machine in the usual way. A dog was used as a driver. The worm gear was placed on the tool block in such a way as to permit it to revolve freely on a pin and on a level with the centre line of the mandrel. The gear blank directly under the cutting point of the hob is supported as shown in Fig. 2. The worm wheel was fed into the hob and allowed to rotate freely about the trunnion pin. The lead of the roughed slots caused the worm wheel to rotate at the proper speed. When the hob was fed into the proper depth the worm wheel was cut. The job is not one that embraced the latest and best in machine shop practice but it is no doubt an interesting example of what can be accomplished in emergency. The amount of time actually consumed in cutting after the hob and milling cutter were made was very creditable.

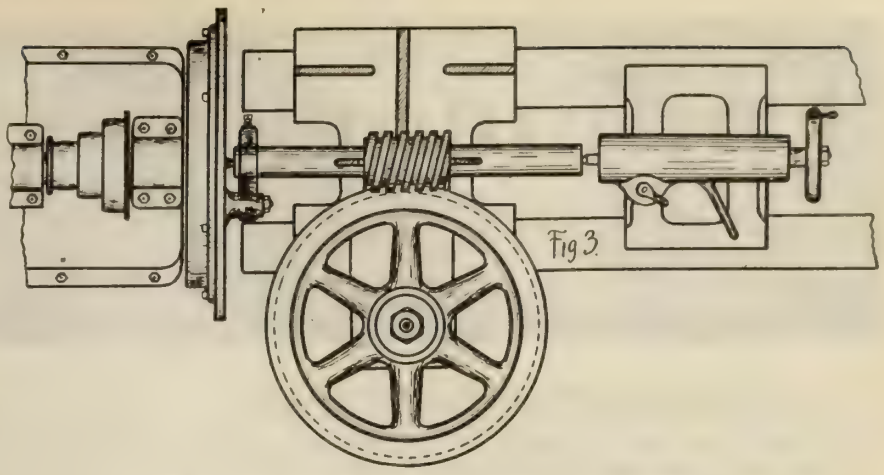


Fig. 3. Plan view of finishing operation on gap lathe.

A deputation headed by one of the aldermen of the City of Toronto has asked the Wards committee to build a new bridge on McClelland Avenue, Toronto. The bridge which is now in place has been condemned and is only capable of carrying a four-ton load. A motion recommending that next year's estimates include an amount for the bridge has been passed. In 1916 it was estimated that $700,000 would be necessary to cover the expenses for the erection of this bridge. Therefore it is safe to assume that the cost today will be around $750,000.

STANDARD TOOL SHAPES ADOPTED

(Continued from page 27)

face at the upper end which catches and serves to hold the tool while it is being adjusted centrally to make the correct diameter of cut, and before the nut and setscrew have been turned home.

Double Angle Iron for Planing Crossheads

This is a very simple device for holding two crossheads on the planer at once, and, at the same time laying out the ways on the crosshead, as can be noticed in the illustration.

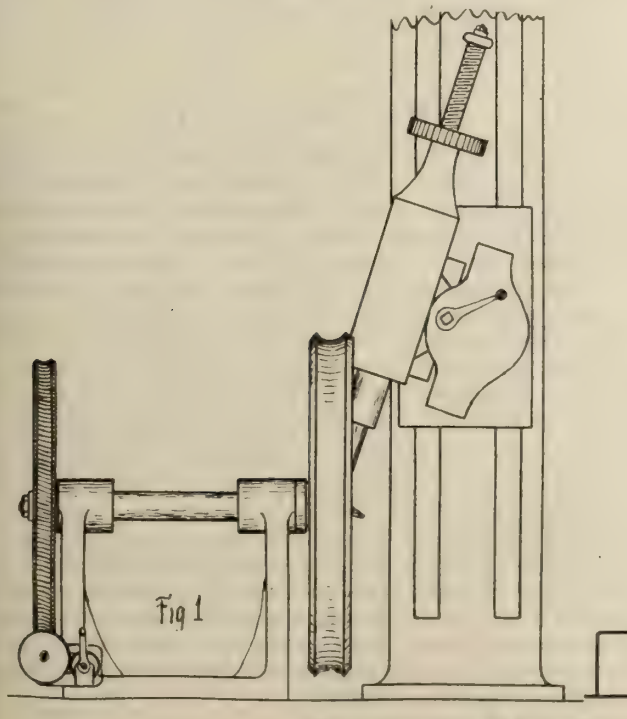

Fig. 1—Roughing out the worm.

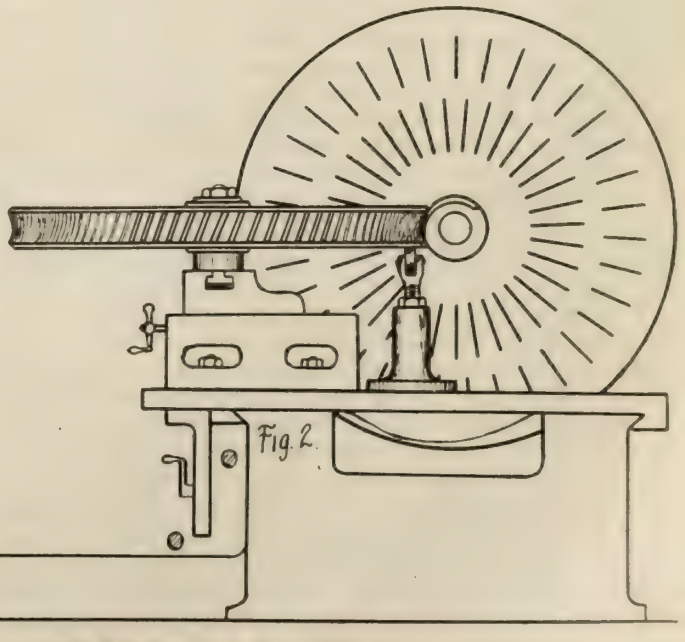

Fig. 2—Finishing on the gap lathe.

Heat Treating Steel Drop Forgings

"IN ORDER to speed up output and complete a stamping with the fewest possible blows," says Practical Engineer, "drop forgers frequently find it necessary to heat the metal to as soft a degree as possible in order that it may flow readily, and the article on leaving the dies is very hot and the steel in a bad state. The structural effect on the steel is that the crystals expand during heating and do not return completely to the fine structure. In some cases fusing occurs around the margin of the enlarged crystals, forming an oxidised film which tends to cause the material to disintegrate. But this occurrence is rare, and when it does happen no amount of forging will reunite the crystals.

"With the ordinary stamping, correction can be made by heat treatment if the heating is conducted within reasonable limits. The stamping must be re-heated up to a temperature depending on the carbon of the steel. For 0.25 carbon steel the stamping should be re-heated up to 820 deg. C. and plunged into whale oil. Not only does this heat treatment split up the crystals into the smallest form, but also it serves to release any internal strains which are apt to be engendered in the formation of difficult shapes. With higher carbon steels tempering after heat treatment is a good practice, the stampings being re-heated to 650 deg. C. and then exposed to air."

Trouble In Machine Tapping

IN DRILLING and tapping by machine there are certain points which should be observed if satisfactory work is to be secured. H. H. Armstrong, speaking on the subject of machine tapping in "Machinery," says among many other things that trouble often arises from the operator doing his own sharpening of the tap end. He puts it in these words:

"This is done by grinding a new taper on the tap, and while this may prove satisfactory for tapping operations on thin work, such practice should not be followed when tapping work in which the tap cannot pass entirely through, as the bottom of the hole will not have full threads. For the latter type of work, bottoming taps should, of course, be used, which permit cutting practically a full thread to the bottom of the hole. Recently my attention was called to some work in which the assembler could not enter the screws to the required depth. On examining the pieces it was found that the tapped holes were filled with the chips from the tap that had lodged in the thread and become firmly attached by a coating of rust. These pieces had to be sent back to the machine shop to be retapped. In this case the operator was required to do the work on his own time. Had he used compressed air to blow the chips out, this trouble would not have been encountered.

"If a steel screw is set down too tight in a cast-iron piece, the threads are likely to become crossed and stripped, especially if the thread in the iron piece is shallow. Success in tapping holes depends chiefly on having conscientious operators who are willing to follow instructions and set their machines up properly for each job. If trouble is encountered, it should be brought to the attention of the foreman, and not covered up to be discovered at some later period. All machine tapped holes requiring any considerable degree of accuracy should be given a thorough inspection with a limit plug gage. The operator can do this if there is no inspector, and the foreman should keep in touch with the work. It has been proved by experience that the quality of a man's work will invariably be higher if he knows that the work is to be inspected. When excessive tap breakage is experienced, it is well to investigate the cause; in many cases it will be found that breakage is due to inefficient holding methods, the work being allowed to move during the tapping operation."

Improving Magneto Design

SPEAKING about magneto design, the British Trade Review says that considerable attention has been paid lately to improving the slow speed work of the magneto, though the means adopted by different makers vary considerably. Some firms taking their cue from the dynamo and motor manufacturers have modified their early designs so as to permit much more thorough lamination of the iron magnetic flux-carrying parts of the armature and pole shoes, and thus obtain better sparking at low speeds with greater economy of active material; others obtain good results by the use of impulse starters, of sliding pole shoes operated by the timing lever, or by other mechanical means. The recent introduction of cobalt steel for magnets enables the magnet to be reduced very considerably in length and yet retain an undiminished strength.

How To Win Trade

HOW CAN WE secure trade? Sir Raymond Dennis, K.B.E., answers this question in System in the following manner. He says: "It is up to every manufacturer to take what steps he deems best to meet existing conditions. Amongst those that are necessary, to my mind, are the following: Write down your stock by 25-30 per cent., and reduce prices accordingly. Admit you made profits in the past, and equalise things by facing the loss. Push for sales at these prices in all parts of the world. Use every means in your power to induce the men's unions with which you are dealing to realise that it is either a case of hard work at relatively low rates per unit of work—or no work at all. Make your preparations complete for taking advantage of the low prices of raw and semi-manufactured materials from abroad, should your workers or sales connections fail in the end to meet you in the matter of cost.

"Be on the watch for any new openings which occur for marketing products at all similar to your own in any market that is open. Do not neglect a product because the market is small to-day. It may be big to-morrow. For instance, we have had successes recently with motor gully emptiers and flushers and motor mowing machines."

DEVELOPMENTS IN SHOP EQUIPMENT

HY-SPEED AUTOMATIC TAPPING MACHINE

The Cincinnati Hy-Speed Machine Co., Cincinnati, Ohio, have recently developed and placed on the market a line of tapping machines, the operation of which is either automatic or semi-automatic. Among the features of these machines is a patented spindle lead and automatic reversing mechanism. Through the use of the spindle lead device the tap is fed and returned in a positive way, entirely independent of the operator. It is claimed that the holes are tapped accurately without danger of threads being stripped or taps broken. The method of changing from full automatic to semi-automatic operation is by means of a half turn of a stop plunger at the side of the control handle.

When operating as a semi-automatic machine the spindle feeds downward, reverses, and automatically stops at the top position. When full automatic operation is desired the stop plunger is placed in the proper position and the spindle automatically reverses at the top and bottom of its stroke and continues to do so until the operator has reason to stop the machine. The depth to be tapped is regulated by adjustable dogs with limit stops. The machines are equipped with S K F ball bearings. They are designed to do right hand tapping but can be supplied with an attachment which will permit left hand tapping to be done. The machines are built in styles from one to three spindles and in two sizes of which the maximum tapping capacities are ½ inch and ⅞ inch diameter in steel. The regular machines are designed to be belt driven and stand on their own pedestal. Bench and belt motor drives are also supplied.

THREE AND FOUR WAY INDEX BASES

About a year ago the Industrial Engineering Co., Detroit, Mich., marketed their two way indexing bases for the first time. By means of this index base, work can be placed on one side of a fixture table while another part is being machined diametrically opposite. Then when the operation on the first piece has been completed, the table can be indexed 180 degrees to bring the unfinished part in line with the cutters. The same company has now placed on the market two more styles of bases which can be indexed to three and four positions respectively. These bases are made the same dimensions as the original style namely 10 and 16 inches in diameter, and the mechanism is based on the same principle.

NEW TYPE OF DOOR LOCK

Not a few aggressive business houses are preparing to make 1922 a much better year than 1921. There is an expressed feeling among them that industrial conditions are improving and that trade can be done by those who hustle for it. Among these firms is International Business Systems Co. of Toronto, whose large shop is now tooling up preparatory to turning out new devices for the registration of time. Chief among these machines is a recording door lock of ingenious nature. It is so constructed that when you put a key in the lock a registration is made as to who opened the door, which key opened it, whether the door was opened from the inside or out, whether it was locked or unlocked and the exact date, hour and minute when the whole operation was performed.

DIE-FILING MACHINE

The R. G. Haskins Co. of Chicago, Ill., have placed on the market a die filing machine suitable for filing templates, dies, tools, etc. The filing spindle is square in cross section and has a provision for compensating for wear. A reciprocating motion is imparted to the file through the medium of a hardened and ground tool steel block. The mechanism is entirely enclosed. A grooved table 9 inches square is provided. This table can be locked at any angle. The motor is of ¼ horse power and is mounted on a slide. It transmits its power to a friction disc. Moving the motor the full length of its slide changes the speed of the spindle from 700 to 300 strokes or revolutions a minute. The equipment is light and portable.

INDUCTION MOTORS

A line of general-purpose, polyphase, squirred cage, induction motors, has recently been placed on the market by the S. A. Woods Machine Co. of Boston, Mass. Up to one horse power the motors are entirely enclosed. Larger sizes are semi-enclosed. The incoming ventilating air is screened as it enters the motor. It then passes baffle plates and is guided over the windings and exhausted through the bearing heads, by the action of a fan. This system of ventilating, it is claimed, will keep the motor free from dirt and oil-soaked windings. The stator housings are corrugated thus giving additional radiating surface. All motors have a temperature rise of 40 degrees C. at full load and 50 degrees C. when carrying a continuous 25 per cent. overload. The bearings are lubricated through the use of wool waste. The stator windings are double cotton covered enamel wire, while the rotor windings are of the cast unit type. The stator and motor may be purchased separately thus enabling manufacturers to supply their own shaft and bearing heads for use in building the motors into standard machines as integral parts of same.

MILLING ATTACHMENT FOR BORING MACHINES

A vertical milling attachment has been developed in the shops of the Blomquist-Eck Machine Co. of Cleveland, Ohio, which can be placed on the horizontal boring machines manufactured by this firm. The attachment can be fitted to any machine that is turned out by this firm as all necessary drilling and machining is done on all standard boring machines. The attachment is supported by a cross rail placed between the horizontal spindle saddle of the machine and the outboard bar support. The vertical spindle saddle of the attachment may be adjusted along the cross rail by means of a rack and pinion. Motion is transmitted to the vertical spindle from the regular horizontal spindle by means of bevel gearing in the vertical spindle saddle.

COMBINATION WORK BENCH

A few months ago the Myers Machine Corporation of Columbia, Pa., introduced to the trade a combination work bench on which was mounted a geared automatic hack saw provided with a vise, a 10″ sensitive drilling machine equipped with a table and a ⅜″ chuck, a grinder with emery and muslin polishing wheels, and a 4″ machinist's vise. This equipment was driven by a ½ horsepower motor. Another work bench similar to this has been recently placed on the market. The new work bench is, however, equipped with a 10″ by 45″ engine lathe having a double friction coustershaft, instead of the hacksaw. This latter bench is known

as their No. 2 Combination Work Bench. The lathe is of standard design, having a hollow spindle, power cross feed, compound rest, thread-cutting mechanism, back gearing, and a three-step cone.

PARALLEL EXPANSION REAMER

A parallel expansion reamer has been developed by H. A. Hopkins and Co., Inc. of South Bend, Ind. It was especially designed to remachine automobile engine cylinders. Five sizes are manufactured ranging from 2¾ inches to 4 inches. Each reamer is suitable for cylinders varying not more than ¼ inch in diameter, and has an extra expansion of 1/16 inch to allow for grinding. The tool consists of only the body, nut and blades. The blades are attached to the body by means of flanges that engage slots in the body. The reamer is equipped with a pilot which permits the blades to enter the cylinder before cutting commences, the reamer then being adjusted to size. A micrometer dial facilitates accurate setting of the blades. A ratchet wrench is provided for actuating the reamer.

SURFACE GRINDING MACHINE

The No. 1 Surface Grinding Machine manufactured by the Wilmarth and Norman Co. of Grand Rapids, Mich., for several years, has been completely redesigned. The machine is now fitted with an adjustable swivel sub-table. Thus it enables the machine to handle angular or irregular shaped work. Suitable graduations to enable close adjustments are provided in connection with the swivelling apparatus. The sub-table is provided with "T" slots, for attaching a head and a tail stock, or a dividing head. A built-in trueing device enables the operator to true up the wheel without disturbing the work on the machine. The machine can handle accurate gauge and die work.

HORIZONTAL HIGH SPEED DRILLING MACHINE

The Acme Machine Tool Co. of Cincinnati, Ohio, have developed a high-speed drilling machine that is especially adapted for drilling small diameter deep holes, such as grease cup holes in king bolts, or similar work. The work is held in a lever operated automatic chuck. The turret slide saddle carries a casting which in turn carries the drill spindle. This permits long or short work be quickly accommodated in the machine. The work ordinarily revolves at 300 r.p.m. and the spindle at 3000 r.p.m. A special design relieves the spindle of all belt strain. A stop is provided which stops the drilling at any predetermined depth.

PORTABLE ELECTRIC DRILL

Two sizes of a portable electric drill have been placed on the market by the Hisey-Wolf Machine Co., of Cincinnati, Ohio. The drills are completely equipped with ball bearings and the electric motors are built by the Hisey-Wolf Co. They are known to the trade as the "Super" No. 38 KU which has a capacity up to ⅜ inch drills and No. 50 KU which has a capacity for drills up to ½ inch in diameter. Coil springs are provided at all ball bearings on the three shafts to allow expansion and contraction to take place without distortion. Quick cable springs are provided at all ball bearings on the three shafts to allow expansion and contraction to take place without distortion. Quick cable connectors are provided at both ends of the cable.

A patented switch is part of the regular equipment, and although externally mounted is protected by a removable handle cover. The brush holder is made of bakelite which is not affected by oil, moisture, or atmospheric conditions.

Forced ventilation is obtained for the commutator and brushes as well as the armature and field coils. The fan is so designed and mounted as to prevent the lubricating grease in the gear head from working into the motor parts.

TUBE MANUFACTURING EQUIPMENT

The Davis-Bournonville Co., of Jersey City, N. J., have recently developed and placed on the market a complete set of machines for the manufacture of welded tubing from commercial sheets. The equipment is designed to handle any gauge sheets from No. 10 to 22 and tubes from ⅝ inch diameter to 4 inch diameter can be manufactured. The equipment consists of a slitting machine which cuts the standard sheets into strips of the proper width to be rolled into tubes. The next machine is the tube forming machine which rolls the tubes at speeds varying from 50 to 100 feet a minute.

Next in line comes the tube welding machine which welds the tubes and can be operated either right or left hand. The oxy-acetylene process is used in the machines and adjustments are made according to the size of tube being welded. A machine for grinding the ridges produced by welding is among the line of equipment. The next machine is a straightening machine. A rotary swaging machine is provided with ten rolls in the head. On this machine specially shaped pipe is produced. The other machines in the equipment are a motor driven tube cutting machine having an oscillating head, a draw bench which has a capacity for tubes up to 2 inch diameter and No. 14 gauge, and several types of tube bending machines. The equipment is quite complete and enables a shop to produce tubes on short notice to any specifications within the limit of the various machines. It enables a shop to take care of a large and varying volume of trade without carrying in stock anything more than a representative range of sheets.

GRINDING AND POLISHING MACHINES

The St. Louis Machine Tool Co., St. Louis, Mo., have added several machines to their line of grinding and polishing machinery. Among these new productions is a grinding machine which has a wheel on each end of the arbor, a similar design of machine for polishing on the other end of the arbor. The column and head is the same in all three machines, being of cast iron, box section. The spindle is equipped with a pulley between the main bearings, which drives the arbor. Bolted to the column is an offset vertical extension which provides a base for the motor which is belted to the arbor pulley. The motors furnished are of the enclosed, repulsion start, induction run, type, either single or three phase, squirrel cage. The three phase motor operates only on three phase circuits at one voltage. The single phase machines operate on one, two, or three phase current at 110 or 220 volts. A direct current motor can also be supplied. Grinding wheels are driven at a surface speed of 5,000 ft. per min., and those on the polishing machine at 7,500 ft. per min. The machines are made in a large range of sizes, in stationary and portable types. The portable types vary in weight from 170 lbs. to 290 lbs.

The firm also manufactures a new design of heavy floor type machine in three sizes, for which wheels of 18 in. x 3 in., 20 in. x 3 in., and 24 in. by 4 in. are respectively recommended. The machine is driven by a central pulley of either the plain or cone type. The bearings are provided with large oil chambers, which are filled and drained through a pipe connection at the back so arranged as to prevent overflow of oil. The weights of these machines range from 700 lbs. to 1.000 lbs.

PORTABLE ELECTRIC DRILLS

Jones, MacNeal and Camp, of Chicago, Ill., have placed on the market a portable electric drill, known as the "Power King." There are eight sizes in the line, having various capacities up to drills of 1 inch diameter. Each drill is equipped with a two speed mechanism. This feature is useful when drilling in two kinds of material, one softer than the other, or in changing speeds for using carbon and high speed drills. Ball bearings are furnished throughout. Combined radial and thrust bearings are placed at each end of the driving shaft. The handle end is provided with a protecting cap of sufficient strength to take pressure from a jack or to resist shocks due to falls and rough handling. The drill parts are very accessible. The regular equipment includes a standard three jaw chuck, interchangeable with a No. 2 Morse Taper Socket, and a quick make-and-break type switch.

The number of motor vehicles of all kinds registered in Great Britain from Jan. 1 to Aug. 31, 1921, was 870,782. The gross amount of taxes collected from the same was £9,876,105, which is distributed as follows: England and Wales, £8,777,863; Scotland, £888,227 Ireland, £210,015.

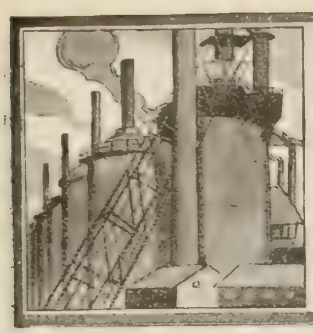
More Than Mere Manufacturing

IN DAYTON, Ohio, the National Cash Register Company continue producing their registers. A short time ago John H. Patterson, founder of this concern, stepped out to allow his son to take his place, but in thus handing over the reins of office, he also left behind him a record of achievement of which anyone might be justly proud.

When Mr. Patterson took charge, about the year 1884, the premises and staff consisted of one room and one man, but business gradually increased until at the present time some 7,000 are employed in production and 2,500 in selling. It is not this point, however, we desire to discuss so much as the obstacles, seemingly outside of the business itself, which Mr. Patterson overcame. When he started his factory the surrounding conditions were, to use his own expression, horrible. Gamblers, thieves and other undesirables infested his neighborhood. Boys broke his windows and did all sorts of damage to the plant. Instead of giving up, Mr. Patterson started to improve conditions on the assumption that the boys were really bad because they had nothing to do. He proceeded to clean up the premises, sow seed, plant flowers, etc., but the boys still broke windows and tore up the flowers.

A school was started and being suspicious at first, the boys came to cause trouble, but remained because of the treatment they received. Clay modeling and other classes were started, and even the girls were included. Gardens were developed, and before long the ring-leaders of the various window breaking gangs were actually in charge of the class activities.

The garden enterprise is now an incorporated company and the boys sell their products to the locality at large. Farm clubs have also been started, and many other schemes, including winter instruction classes in many trades. Similar classes have also been successfully run by the employees of the C. N. R. Co. and last year alone over 1,500 enrolled, 600 of whom graduated. To explain in detail all the schemes which are in force in the plant at Dayton would be impossible in this space. Suffice it to say that Mr. Patterson has amalgamated human nature and manufacturing with wonderful results. Every employee is proud to belong to his organization, and anyone submitting an improvement of any nature is given full credit for it.



There is a lesson to be learned from Mr. Patterson's activities. We are apt to look on manufacturing as a cold-blooded business proposition, but if we mix human nature with it, and let the worker feel it is his personal business just as much as his employer's, it is wonderful the talent that can be brought out. Workers do not wish charity, but they do demand rightful recognition. Local difficulties and dissension in the ranks, can be cleared away by a common sense treatment of any trouble.

Waterways Scheme

WE HAVE from time to time commented on this proposition, and we are brought back to the subject by an editorial in a daily newspaper, which claims that the force of opinion of the twenty million people living on the shores of the Great Lakes will overcome all opposition to the scheme. It further says that nothing can prevent the St. Lawrence and the Great Lakes becoming the Mediterranean of America. We disagree with this viewpoint. One of the things that will inevitably prevent the Great Lakes becoming the Mediterranean of America is the fact that for six months of the year they are useless for navigation purposes. Further, they will be approached not by a channel twenty odd miles across, like the straits of Gibraltar, but by tortuous canals made more difficult by locks. Of the twenty million people mentioned the number living along the Canadian shore of the Lakes is a very minor part. As to the power question, we have had unfortunate examples of how far out estimates can be when a particular scheme is being pushed. The Chippawa development in Ontario that started out as a modest scheme to cost about $10,000,000 has now cost over $50,000,000 and the end is not yet. This question is not one for ill-informed politicians or boosters to settle, but requires the fullest and most painstaking investigation by experts. If it can be shown to be feasible beyond all doubt as a power proposition, then subject to suitable guarantees it may be gone on with. As far as navigation is concerned, we have very many doubts about ever seeing large ocean steamers docking at Port Arthur or Fort William, canals or no canals.

MARKET DEVELOPMENTS

Not Much Activity on the Various Markets

Prices on Pipe Have Dropped About $5 to $6 a Ton—Production of Steel Likely to Drop Within the Next Two Weeks—Machine Tool Market Dull—Small Tools Hardly Moving.

THE MARKET during the past few weeks can be likened to an elevator. It has its ups and downs. December is always looked upon as a quiet month in the steel market, and yet, locally, we find that this month will show an improvement over November. Not that the volume of business has been large, but it has been more than was expected. The machine tool market, locally, is very dull, while the metals continue to show strength. Copper leads the list in this respect.

Pittsburgh reports an increase in discounts on standard steel pipe, also line pipe, this in turn effecting reductions of approximately $5 to $6 a ton. Oil country goods are also reduced about $5 a ton.

Pipe mills are operating at various rates, from about 60 to 80 per cent. capacity. Taking the rest of the steel industry as a whole, it is hardly operating at an average of 40 per cent. It is figured that the industry is producing about 21,000,000 tons a year, against only about 10,000,000 tons at the middle of last July. Prospects are, however, that the production of steel will decrease considerably in the next two or three weeks, on account of mills closing for short periods, either over the holidays, or for the first week or two of the New Year.

Very little activity exists on the Montreal market. With the exception of tin, prices remain unchanged. There have been a few orders for rails, but nothing of importance. Machine tools are very quiet, although small tools and supplies are moving in fair fashion. The metal market is firmer, having strengthened in sympathy with the new York and London markets. Should the demand on copper increase to any extent, an increase in price would not be surprising. The scrap metal market continues dull.

DISCOUNTS ON PIPE ARE INCREASED REDUCTIONS AROUND $5 AND $6 A TON

PITTSBURGH, December 20th.—The National Tube Co., (Steel Corporation) issued new price lists dated December 15, increasing discounts on standard steel pipe and O. D. pipe 2½ points, and discounts on line pipe three points, effecting reductions of approximately $5 a ton respectively, oil country goods being also reduced $5 a ton. These lists supplant those of September 16, which also represented reductions, the basing discount on pipe changes from 69½ to 71 per cent. off list.

The steel corporation's action was prompted by continued shading on the part of independents. This shading began shortly after the reduced lists of September 16 were issued, the reduction at that time having also been caused by the shading of independents. The shading gradually spread until it became practically universal among the independents on all their business, but it did not go much deeper. In standard pipe the usual thing was to give customers an extra 5 per cent. discount, beyond the regular trimmings of the leading interest. Frequently the independents give an extra 2½ per cent., and they claim they must do so on account of the consignment method the leading interest follows so largely in marketing its product.

While a strongly competitive condition existed the independents were deterred from cutting prices more deeply because they had 60-day price guarantees outstanding. The reduction now made by the leading interest goes deeper than the shading in the case of standard pipe. In line the reduction is merely in the price at which small lots are sold, for on large lines there is practically always a large concession given by any seller. Recent large line pipe orders have gone at $20 to $25 a ton under list prices, whereas the list prices are now reduced only about $6 a ton.

Prices Almost Stationary

The decline in tubular goods is interesting in itself and interesting in the commentary it gives on the general steel market situation, which has been that of prices remaining practically stationary on account of buying being rather light as a whole, and orders individually being small in size. There has been little incentive to make further cuts in price, even though there is a strongly competitive spirit throughout the trade. Tubular goods constituted an exception to this rule of there being a light demand, hence prices yielded. It is not an unfair assumption that if there had been heavy demand in another line of finished steel products the price would probably have yielded likewise. Experienced market observers have been predicting for several weeks that should a general disposition to buy develop, particularly for forward delivery, fresh declines would occur in the products involved. The declines would not be large, only a very few dollars a ton, as there is not room for declines. Prices in general are approximately at cost of production, with the present operating rate. With a higher operating rate costs would be somewhat lower. In tubular goods it appears there was a fair margin, and with the expectation of a heavier operation in prospect, mills were more ready to make concessions. Pipe mills are now operating at various rates, say from 60 to 80 per cent. of capacity. Taking the rest of the steel industry as a whole, it is hardly operating at an average of 40 per cent.

Steel ingot production reached a maximum, about November 1st, of 25,000,000 tons a year or perhaps a trifle more. The steel corporation and independents were operating at very nearly the same percentages of their respective capacities, say 48 to 50 per cent. Since then independent mill operations have decreased very considerably, while the steel corporation maintains its operations fairly well. For the industry as a whole the rate is probably about 21,000,000 tons a year, against only about 10,000,-

000 tons a year, at the middle of last July.

The better operation the steel corporation has as compared with the independents has been more or less in evidence for about a year past, and is due to the inceased good will the corporation acquired in 1920, by holding down its prices when the independents made large advances. Not only has the corporation a better operation, it has secured, on an average, slightly higher prices than the independents.

Prospects are that production of steel will decrease considerably in the next two or three weeks, on account of mills closing for short periods, either over the holidays or for the first week or two of the new year. Some have made a particular effort to operate in the past few weeks in order to give the workmen some holiday money. By the middle of January steel production should, in normal course, begin increasing, to reach something like the rate early in November, say 25,000,000 tons a year. The approach of spring may bring enough additional consumptive demand to push the rate still higher. From the present outlook the fairest guess seems to be that at no time between the middle of January and the middle of August will the rate be as low as 20,000,000 tons a year, in ingots, or as high as 35,000,000 tons. Production made a record in 1910, at 25,000,000 tons, while in both 1912 and 1913 about 30,000,000 tons were made. In other words, production next year is likely to make a fairly favorable comparison, in tonnage, with the best pre-war years, but some observers, thinking simply of the enormous capacity that has lately come into existence, regard the prospects as poor, since a 20,000,000 ton rate would be only 38 per cent. of capacity and a 35,000,00 ton rate would be 67 per cent. of capacity.

Prices in Detail

Bars, shapes and plates remain quotable in general at a range of $1.50 to $1.60, but the $1.50 price is more generally in evidence than formerly, and $1.60 is rather exceptional. If particularly desirable orders were going, $1.50 would perhaps be shaded on such orders. The sheet market can usually be depended on for developing interesting news. Recently it was the most irregular of all the finished steel markets, there being deep cuts interspersed with attempted advances, some of them successful. Now sheets have gone to the opposite extreme, for the market is firmer than that of any other finished steel product. In fact, it appears that the prices of $3.00 on black sheets and $4.00 on galvanized sheets are now being held with absolute rigidity, no buyer being able to secure even the slightest concession.

Tin plate is easier. The shading done for several weeks by one or two mills has spread until now several of the independents are shading somewhat freely, selling at $4.65 or less when the regular price, maintained by the Steel Corporation, is $4.75.

POINTS IN WEEK'S MARKETING NOTES

The discount on standard steel pipe has increased 2½ points, and 3½ on line pipe, this causing reductions of approximately $5 to $6 a ton. Oil country goods are also reduced $5 a ton.

Steel prices remain stationary, but if an active demand existed, it is quite possible declines would take place on this market also.

Steel ingot production reached a maximum about November 1, being about 25,000,000 tons a year. Since then independent mill operations have decreased considerably, while the Corporation holds its own very well. An average production for the industry would be about 21,000,000 tons a year against about 10,000,000 tons at the middle of last July.

Bars, shapes and plates are quotable at from $1.50 to $1.60, but the $1.50 price is general. $3.00 for black sheets, and $4.00 for galvanized, are being held with absolute rigidity. Tin plate is easier, selling at from $4.65 to $4.75. Foundry pig iron is selling at from $19.50 to $20.50 valley; bessemer remains at $20, while basic is still at $19, both at valley furnaces.

The local steel market is quiet. Tubes and sheets are the only active members, and even this activity was not expected. Compared with November, the present month will be much better than the former. Machine tools are dull, while the metal market shows continued signs of strength.

Montreal reports a quiet week on all markets. Very little business is moving, and with the exception of tin, prices remain unchanged. Machine tools are rather dull, but small tools and supplies are moving not so badly. Non-ferrous metals are stronger, but the scrap metal market continues to be dull.

Pig Iron

Foundry pig iron has been quotable for weeks past at $20.50, valley, the price lately becoming practically nominal as there were no transactions of importance to test by In the past ten days a few relatively small inquiries have come into the market, and they developed a price of $19.50, at which the market is now quotable. Bessemer remains at $20 and basic at $19, both at valley furnaces. Whether these prices would be shaded on a nice order remains to be seen, the balance of probability being in favor of the buyer.

TORONTO MARKET IS VERY QUIET

TORONTO, December 20th.—"I think a good plan would be to have a gramophone record made, playing it over for you each week as you enter the door." In these few words a steel dealer unconsciously summed up, in a rough way, the local steel situation. With slight variations, the same report of a month ago would cover activities at the present time. For some unforeseen, and unlooked for reason, business has been better this week, but this is taken simply as a last spurt before the winter vacation period sets in. Boiler tubes and sheets were active during the past week, and even dealers themselves do not attempt to explain the demand. It was there; they were pleased to get the business, but they do not expect the demand to last. Apart from these two numbers, the steel market is merely moving. Compared with November, the month of December will be the better one from a business standpoint. As January and February are always dull months, no move of importance can be expected on the steel market for some time.

Machine Tools

The machine tool market is very quiet these days. A few dealers report good sales, but this is too spotty to be of any special significance. It's a case of turn about fair play. The dealer who was busy last month may be the very one who shows poor returns this month. There is no definite demand, and dealers themselves refuse to comment on what the New Year will bring forth. On several occasions, this market has shown signs of life, only to fall back again into the now familar rut.

The small tool trade has diminished almost to the vanishing point. From a healthy member, it has developed into a very sick patient. When it will regain its strength, no one cares to predict. As long as manufacturers keep to their hand to mouth buying policy, this market will not improve much.

The metal market continues to show signs of strength. During the last two or three weeks copper has shown more activity than at any other time in 1921. Not only has the price advanced, but the demand has increased. Tin is a rather speculative material at present, and the existing price is not expected to hold. Lead has surprised quite a number, because, although it is generally understood that December is a poor month for this metal, there has been more lead sold within the past two weeks than in the complete month of November. Trading in foundry scrap is light, and until a larger volume of business is secured by foundries throughout the country there will be no improvement in this section. A more complete story of the metal market follows this brief report.

BRIEF SURVEY ON METAL MARKET

SPEAKING on the condition of the metal market at the present time, Ernest W. Knight, of Frankel Bros., Iron & Steel merchants, Toronto, says that copper has shown more activity in the last three weeks than it has at any previous time during the year.

"The rise in price has been steady and gradual," continues Mr. Knight, "and is likely to be maintained for some little time yet, but I do not anticipate a continued advance beyond 14½c. to 15c. per pound. I am under the impression that after the present movement has subsided, which will probably be during the early part of January, the metal will again settle back to about 14c. level, at which it will remain until the buying movement starts for second quarter copper. I do not anticipate any reduction and there may possibly be some further advance, and I would suggest that the present time is opportune for covering requirements for the first quarter."

"I understand that electrolytic copper has been sold for first quarter at 14½c., New York. If this is worked out on a basis of 8 per cent. American Funds, it will be seen that electrolytic ingot, laid down in Toronto, costs $17,-40. I presume that the Tadanac people would offer Canadian ingot in the neighborhood of 17¼c. I wonder if Canadians realize that with the single exception of the Central Powers and Russia, non-ferrous metals are more expensive in Canada than they are in any other country in the world.

"Tin is again in a highly speculative market, and it is extremely difficult to forecast what is likely to happen, but I understand the squeeze which was existent during the past two or three weeks, has been removed, and I look for prices being a little lower for the rest of the year. The market is extremely difficult to forecast, but I would recommend only purchasing for present requirements. In regard to tin, readers will probably understand that the forces controlling the output and marketing of this material, are ruled by one of the most exclusive rings in existence, with millions of capital behind them. Unless something unforeseen happens, there is no reason in the world why tin should even maintain the price at which it is being offered today.

"Spelter shows signs of strength, but I do not anticipate any noticeable advance for some time to come. Zinc producers seem to have the market well in hand and are refusing orders at current market prices, which would seem to indicate that when the first quarter demand really makes itself felt, higher prices will be the rule of the day. I do not think anyone would make a mistake by covering their requirements for first quarter zinc right now. Prompt shipment zinc is being quoted at $4.85, East St. Louis, and this price, on a basis of 8 per cent. American Funds, means that Prime Western to-day, costs $6.75 per hundred pounds. f.o.b. Toronto. The Tadanac people will probably quote $6.65 to $6.70, but I have been unable to confirm the actual Canadian quotation.

"Lead is also an uncertain commodity to-day", concluded Mr. Knight, "and it is hard to prophesy what is likely to happen in the near future. Generally speaking, December is a very quiet month in the lead markets, but it is a positive fact that within the past two weeks, more lead has been sold than during the entire month of November. This is a most unusual state of affairs, and it may lead to some little fluctuations. The American Smelting & Refining Company's price is quoted $4.70, both East St. Louis and New York, which also is an unusual feature. The outside market is quoted at $4.40 East St. Louis and $4.75, New York. I do not look for any advance worthy of note in lead and think that first quarter buying can be satisfactorily left until after the first of January."

PRICE OF TIN ADVANCES SLIGHTLY— NOT MUCH ACTIVITY ON MARKET

MONTREAL:—Probably the next two weeks will be the quietest of a very quiet year. Very little business has been moving and prices with but few exceptions have remained unchanged. The financial reports of some industrial firms have been published and all show reduced earnings, and consequently have declared smaller dividends. Generally speaking, everyone unconsciously compares these reduced earnings, to the abnormal profits which were so common during the war years. This method of comparison is not good practice. Most of these companies are financially sound and are only fortifying themselves against the future, and it is a sign of strength and foresight to be able to present such reports, which in nearly all cases show reduced bank indebtedness, small stocks of raw material, and reasonably large cash or liquid assets. However, owing to the Christmas season, many of the larger machine shops in this locality are closed, there being little business offering. Thus the purchasing departments of many concerns are not actively functioning in as far as actually placing orders, is concerned. These departments are, however, watching the markets with eagle eyes; collecting quotations on various lines; sending out many pertinent inquiries, and in a multitude of ways showing there is a general consensus of opinion that early in 1922 business conditions will revive. The disturbing factor of the general elections is a matter of the past. The calendar year of 1921 will have soon passed, the quiet season during the Christmas recess is rapidly approaching, therefore we have more than the usual quota of reasons to believe that we are turning over a leaf and starting on a new sheet, free from many of the fettering entanglements of the present season.

Business in the steel end of the industry is rather dull but not the least discouraging. There have been a few small orders for rails from the Canadian National-Grand Trunk System, divided between the Algoma & Dominion Steel Corporations. There is a light trading in merchant bars. Structural steel is also in light demand. Sheets and plates are moving but not in any greater volume than for the past few weeks. Cold rolled steel and tool steels are very quiet Prices for all the various steel products remain unchanged at the prevailing low levels.

Pig Iron also shows small activity and the prospects are not rosy for any sudden change for the better. There is no doubt that as soon as general retai conditions show any marked sign of improvement, foundries will be among the first to feel the better conditions reflected in increased activity. Prices o pig iron remain unchanged and really are somewhat low all matters considered.

Machine tools are still very quiet. Before this line of trade increases to any marked extent, several other movement in the chain of business must act a "prime movers." Retail conditions mus create a demand from the industria and manufacturing concerns. Thes firms at present have much idle machinery, and until this machinery is place in a fair way to earn its keep, the manufacturer is not going to be intereste in the ordinary type of general purpos machine. The single purpose machin the automatic lathe and screw machin brought up to the last minute in design, will have a certain amount of interested prospects. To sell this type machine it is often necessary to ca into play the best engineering ski available in the designing departmer of the manufacturer. New develo ments in standard machines, that woul enable them to enter into competitio with specially designed machines in pr duction work, but at the same time ha a broader field of application, are a tracting the eye of the engineering d partments of many large firms and all probability some of these types machine tools will enter largely in specifications for new equipment. Ge erally speaking, prices are gradual coming down to a very reasonable lev but are still above pre-war prices.

The small tool and supply busine continues to be an active factor in t business. The volume has dropped off little and prices are undergoing a sl

(Continued on page 44)

INDUSTRIAL NEWS

A fire recently damaged the planing ill and machinery owned by Reid & ., Berkeley St., Toronto, to the extent $50,200.

Construction of a glass factory at colette, Que., is contemplated by the nerican Optical Co., and will cost ap-oximately $75,000.

The Hamilton Tar and Ammonia Co., rolina St., N., Hamilton, Ont., will ct a factory and warehouse at Ot-wa, Ont. costing $50,000.

E. S. Manny & Co., 27 Cote St., Mon-al, Que., report very good business in ir line locally and have had to turn ay orders lately.

Fire losses in Canada during the ek ending November 30th are estim-d by Monetary Times at $258,500, mpared with $334,000 the previous k.

The Preston Mineral Springs Co., plan erection of a hotel and a sanatorium cost $250,000.

lans will be prepared for a public mming bath to cost $150,000 for the of Ottawa, Ont.

two million dollar bond issue to fin-e the construction of roads in British Columbia, was sold recently by the Gov-rnment to a large Toronto financial sy licate.

onstruction of retaining walls at a co of $100,000 on the Rideau canal, is co emplated by Ottawa improvement co mission. Plans are also being pre-ed for a swimming pool to cost $2 000 for the city of Welland.

ork has just commenced on the new ga ge, service station, offices and show rocs for the Gotfredson Joyce Corpor-ati, at 242 Spadina Ave., Toronto. Th John V. Gray Construction Co., of To nto, have the general contract at a pri of approximately $80,000.

e Fuller Brush Co., Toronto, Ont., wa exporting to Canada in 1920, and sal were $5000 a month. In 1921 the commenced to manufacture in Can-adand sales are now $80,000 a month. 250 alesmen are being employed.

Aquarter million dollar steel and ce-men bridge which has been erected in the icinity of Milton, Ontario, is comple and ready for traffic. The bridge is a ong the largest in Canada and cov-ers span of nearly 1,000 feet. It is 125 eet high and the traffic floor is 20 feet n width.

Mr. Grayson, American manager William Jessop & Sons, Sheffield, England, was on a visit to their Toronto office a few days ago. He is in charge of the Washington plant, and also has charge of their other interests in the United States.

The Simplex Iron and Tool Co., has been incorporated to manufacture adjustable wrenches. They are located at 216 Adelaide St., W., Toronto, and Mr. Dunlop, president of the Dunlop Coal Co., is also president of the above mentioned concern. Mr. Harington of the Harbor Commission, is vice-president of the new firm.

The Ingersoll Machine and Tool Co., Ingersoll, are developing an ironing machine of size and type that is said to be more easily adaptable, in size and price, to average domestic requirements. It is operated by electricity and heat may be supplied either from gas or electricity.

The Hiram Walker Metal Products Co., Walkerville, are overhauling their foundry and installing the latest equipment, for the handling of grey iron castings on a production basis. Included in the plant is a Whitney self-feeding cupola. A separate building is being fitted up for the production of chromel (element) wire.

For the purpose of testing the valve, water was, for the first time, turned into the penstock of No. 1 generator at the Chippawa development on Tuesday. Formal opening of the plant is expected to take place on December 28th or 29th. There is some concreting work to be done, removal of wood structure and machinery before actual completion of the work.

After going the round of the world's markets including German, French, Swiss, British, American and Canadian, says the Mercantile-Guardian, an English publication, buyers have found that Canadian aluminum is cheapest. They also state that the Canadian product is of beautiful quality—the best seen for some considerable time. It is also pointed out that such aluminum often goes by the name of American, because it is shipped from New York.

The Dennis Wire and Iron Works, London, have the contract for installing solid bronze cages and grill work in the new head office of the Banque de Hochelaga, St. James St., Montreal. The contract is in the neighborhood of $17,000. They are also installing the fireproof stairways in the new public utilities building at Galt. Mr. E. R. Dennis reports conditions in their particular line to be very satisfactory at the present time, the demand for metal lockers, shelving, grillwork, etc., being representative of a wide range of activity.

After more than a year's inactivity Canadian Creosote Co. will resume operations of a Transcona plant next year at full capacity. This is according to a statement made by W. E. Dean, director of the company. The resuming of operations will give employment to 250 men, the plant to have the capacity of one million ties a year.

Word has been received from Montreal that the International Paper Co., is planning to start its newsprint mill at Three Rivers, Quebec, during the month of February. It is understood that the initial production will be 100 tons a day from two machines with a capacity of 50 tons each. It is planned to increase this amount shortly, if the market warrants, by another 100 tons a day, making the total production 200 tons a day, or 60,000 tons per year.

Mr. F. W. Staples, a dealer in Ford cars at Ingersoll, Ont., has been busy recording the best year in his business history. By sheer hard work he has sold over eighty new cars, 12 trucks, 14 tractors, 11 tractor plows and many thousand dollars of accessories to say nothing of repairs and used car sales. He enlarged his premises and added to his equipment. His 1921 business shows an increase of about 33 % over that of 1920.

In the report of Mr. E. L. Cousins, Department of Industry, submitted to the Board of Control of Toronto this past week, the definite opinion is expressed that normal times are already here. Mr. Cousins stated that the representatives of 17 United States industries have recently investigated manufacturing possibilities in Toronto, and, in the adjustment of the department, there are excellent chances of a number of new branches being opened shortly.

Young Lyle appearing for a local financial house, whose name he refused to divulge, has asked the property committee of the city of Toronto to let his firm erect a 17 storey building on the North West Corner of Bay and Adelaide St. After some discussion the application was granted. The building is to cover an oblong 200 by 132 ft. Mr. Lyle urged the committee to come to a decision, as a million and a half dollars was involved in the transaction, which would have to be put through at once.

The General Forgings and Stampings Ltd., Merritton, Ontario, have increased their capital to $650,000.

Application to erect a new planing mill, with machinery and steam boiler, by the Rastall Lumber Co., of Dawes Rd., Toronto, has been granted.

The Montreal Cottons Ltd., are enlarging their yarn manufacturing plant to make yarn of the finer counts for sale to the trade.

The Canada Paper Co., Windsor Mills, Quebec, have just put into operation a new boiler plant in connection with their St. Francis mill and it contains three 250 h.p. water tube boilers and has room for a fourth.

Among the new members entered on the roll of the Canadian Manufacturers Association for the month of November are the John McCrae Machinery & Foundry Company, Lindsay, and the Atlas Engineering & Machine Co., Toronto, Ontario.

The Prest-O-Lock Co. of Canada Limited, with head office at St. Catharines, Ontario, has been incorporated with a capital of $50,000 to manufacture automobile locks.

The Climax Rubber Co., of Canada, with head office at Dunnville, Ont., has been incorporated with a capital of $1,500,000 to carry on a general foundry and machine shop business and to manufacture every description of iron and steel and other metal works.

Negotiations between the city of Peterborough, Ont., and the Canadian Pacific and Canadian National Railways, for construction of a Union Station has begun to bear fruit. The C.N.R. has given its approval to the scheme and the three parties have agreed on the site for the erection of the station.

The D. Moore Co., Hamilton, have added a line of electric ranges to their present list of products. These ranges are being offered to the public this winter along with the Sunfire electric grate. The latter mentioned is adaptable for house, office or store use. The company have also added to and improved their different lines of popular ranges.

At the last meeting of council of the British Empire Producers' Organization a resolution was passed unanimously approving the successful visit to Canada on behalf of Empire trade by the Chairman, Mr. Ben H. Morgan. As a result of this work several Canadian industrial organizations have applied for affiliation and a number of Canadian firms and public men have been elected as associate members of the organization.

German manufacturers of machinery are said to be steadily regaining their markets in Japan. It is stated that immediately after the war, orders for machinery were placed with Germany for goods peculiar to German manufacture. It has been found, however, by subsequent trial orders that the goods received are equal to those produced before the war, and it is claimed that prices are lower than those asked for British and American goods.

The organization is announced of the Ruddy Mfg. Co., Brantford, Ontario, who are to take over the unit of the plant of Ham Bros. on January 1st., 1922. Kitchen cabinets, woven wire goods, and bee keepers' supplies are made. Mr. Joseph Ruddy, now vice-president of the Canada Starch Ltd., becomes the general manager of the new company. Ham Bros. are taking a large financial interest in the new company and their president, J. C. Ham, is one of the directors.

The Consul for the Republic of Mexico at Toronto writes that he has been instructed by the Government to inform persons wishing to go to Mexico that their passports must be stamped by the Mexican Consulate nearest to their place or residence, and not by the Consulates at the Mexican frontier towns.

The Consulates in Canada are at Toronto, Montreal and Vancouver. The charge for stamping a passport is ten dollars, United States funds, or the equivalent in Canadian money. Two photographs must be sent with passports.

Brantford, Ont.—On account of His Honor, Lieutenant-Governor Harry Cockshutt having to reside at Government House, Toronto, during his term of office, he has resigned as president of the Cockshutt Plow Company, and vice-president, George Wedlake, has been elected to this position. Colonel Cockshutt will still retain his connection with the company as chairman of the board of directors. Mayor Wedlake, who was vice-president and general manager, now assumes the dual post of president and general manager.

The Postoffice Department advises that a large number of letters addressed to Great Britain and other places in the Empire are being mailed prepaid at the old rate of postage. The new rate of postage on letters to the United Kingdom and other places within the Empire is 4 cents for each additional ounce or fraction thereof. It is emphasized that such letters when insufficiently prepaid are sent forward surcharged double the deficient postage, and in order to avoid this it is suggested that care be taken to prepay properly the postage.

The Vancouver Magnetic Steel Smelting Co. is endeavoring to obtain concessions from the City of Nanaimo in consideration for the erection of a 50-ton electric steel-smelting furnace, which is to be the first unit of a much larger plant. The company claims to have spent $67,000 in experimental work, and to be backed to the extent of a million sterling British capital. The company proposes to develop water-power from the Nanaimo river, and to erect a plant at the water front. It is asking from the city a free site for the plant, and freedom from taxation for a number of years. A committee of representative citizens has been appointed to inquire into the company's status and requests. In the event of such inquiry being satisfactory, it is likely that the requests may be granted.

Edward Beck, secretary of the Pu and Paper Association in an address "The Outlook of the Canadian Industry before the Montreal Paper Club, sa that the paper mills of Canada could a would produce a million tons of new print during 1922. As to other pu and paper products, Canada has reac ed a point where it could produce in a dition to newsprint, 138,678 tons board, over 15,000 tons of fine pap 60,000 tons of wrapping paper, and 024,796 tons of pulp of various grad giving the industry a total annual to nage exceeding 2,300,000 tons. H views concerning the future were ve optimistic.

Christiania, Norway:—Mr. H. P. M tet, a mill owner of Aalesund, Norw has invented a new twisting machine, t principle of which is that, in contrast types now used, the bobbin-spool rotat as the same time as the spo which takes up the ready-made thre a process resulting in spinning fr both ends, which has not previously be done. The process is said to give greater firmness and strength in t thread than does the present method. is claimed also that the new machi works about seven times the speed the machines now in use. The invent has already taken out a patent in se eral countries under the name "Mittets Cabler." He is now making journey through Europe, and will a visit America in order to demonstra his new patent.

Trade Commissioner W. McL. Cla at Milan, Italy, says that he has been touch with an important firm of che cal importers at Milan which wishes obtain supplies of caustic soda and c bonate of soda in Canada. The t countries generally furnishing the la est quantities of these products to It in the past have been Great Britain France. Now, however, owing to agreement between two well kno manufacturing houses in Paris and L erpool by which the English house dertakes not to export its products Italy for two years, it would seem, marks the Commissioner, that Canad producers would have a favorable portunity for the introduction of th products. What is principally requi by the Italian trade is caustic s (66/67, 70/72 and 76/77), the sec formula being the one most freque asked for. If Canadian prices quality were in competition this firm alone would be prepared to take least from 4,000 to 6,000 tons of cau soda per year. During 1920 the t importation of caustic soda into I amounted to 23,459 tons, of wh France supplied some 8,611 tons, G Britain 7,006 tons, and the Un States 7,381 tons. It may be poi out that the Italian duty on liquid c tic solda is 2 gold lira per quintal, on solid caustic soda 4½ gold lira pe quintal. Canadian firms interested w be well advised, the Commissioner e lieves, to get in touch with the Milan n quirer.

The Stoney Oil and Gas Co., Winnipeg, Manitoba, has been incorporated with a total capital stock of 1,000,000 for the purpose of mining oils.

Yowles and Rottenberg Co., builders, will erect a building at the corner of Richmond and Sheppard Streets, and another will be built at the corner of Bay and Adelaide Street, Toronto.

Fire at Sydney, New South Wales, caused damage at $5,000,000. Among the buildings destroyed was the Pastoral Finance Association's wool stores opposite the circular quay, the loss of 30,000 bales of wool resulting.

Two office buildings in addition to the structure which will be erected by an insurance company at the corner of Bay and Temperance St., Toronto, are to be erected in the down town district, although real estate firms interested in the buildings were unable to state as to the exact date for commencing operations.

The water supply of Montreal has been increased 25,000,000 gallons a day by the action of the Water Board cutting a hole in the banks of the St. Lawrence, which enables the river to flow into the completed part of an aqueduct that has been under construction for the past twelve years.

Many important changes in grounds and buildings were foreshadowed at the final meeting for the year of the Canadian National Exhibition directors this past week. Over $1,500,000 has been spent in the erection of new buildings for Toronto's Exhibition within the past 9 months. This is exclusive of the new cold food building.

The Agent-General for Ontario in the British Isles, Mr. William C. Noxon, has just arranged for an Ontario Government film illustrating lumbering to be shown at more than 1,000 Cinema Houses in Great Britain and Ireland during the next twelve months. This is in addition to a large number of Ontario films which are in constant circulation in the old country.

Contracts for the construction of the extension of the Timiskaming and Northern Ontario Railway, seventy miles beyond Cochrane, will, it is expected, be let within a few days. The Ontario Government and the T. & N. O. Commission is anxious to see the work on the extension started as quickly as possible. By November next the commission desires to have 50 miles of track laid, so that supplies and material will have to be taken in before the middle of March.

The complete Toronto factory equipment of the Thompson Knitting Co., has been brought to Bowmanville, Ont., and is now in operation with the exception of a few machines, which are being installed. The new industry is already proving a big asset to Bowmanville industrially. The total capacity of the mill is 700 dozens pairs of hosiery a day, and as the machinery is installed and the apparatus becomes efficient the factory is gradually working up to capacity. There are at present more than 75 on the pay roll, and additional employees are required, which will increase this number to more than 100. The company has sufficient orders on hand to keep them going full capacity up until next June.

There is a movement afoot providing for the establishing of a carding mill at Orono near Cobourg, Ontario. The movement is part of one that is seemingly becoming general throughout Ontario, on the part of farmers, to have their wool manufactured in their own district. A committee has been appointed to get details of manufacturing expenses and machinery. No mention has yet been made whom this information is being gathered for.

Manufacturers in the Eastern part of the Dominion are showing much more activity in their respective industries. One Montreal branch of a large United States concern which had not issued catalogues for three years, is now having one prepared which will be the most elaborate it ever put out. A Toronto branch of another United States firm whose far reaching interests have placed it in the front ranks of world industries and its reputation business foresight, is making extensive preparations along these lines. In the store and heating industries two large campaigns will shortly be under way. A kitchen cabinet manufacturing concern in ordering its catalogue was elated with present conditions.

Extensive plans for the development of the natural resources of Newfoundland with the immediate employment of two thousand men was announced by Mr. P. C. Reid, president of The Reid Company, New Foundland, the other day, on his return from a three months' visit to Great Britain. Mr. Reid said that while in London, England, he had negotiated a contract with the Armstrong Whitworth Co. of that city to develop the resources of the Humber Valley. Under the project, he continued, paper mills would be established twice the size of the large Farmsworth plant at Grand Falls which supplies newsprint for the Northcliffe papers in London, with a capacity of 1,000 tons daily. Mr. Reid described the contract of guaranteeing the expenditure of $7,000,000 within two years with the establishment of aluminum works and other industries at Grand Lake and extensive water power development.

The city of Sherbrooke, Que., is showing a very encouraging activity in building and construction at the present time. St. Charles college is making an extension to cost $5,000. J. Guay is building a duplex on Mary Street costing $10,000. The Corporation Episcopal of Sherbrooke is erecting a chapel at a cost of $12,000 and Mr. E. Bradley will erect four apartments and three stores at a cost of $15,000. These may be only small items, but it goes to show that building activity is not at a standstill. The same city is also going to build a new city hall to cost $75,000.

Total contracts awarded for construction in the Dominion of Canada for the month of November 1921 totalled over $16,500,000.

The Algoma Steel Corporation secured an order for 6,000 tons of rails from the T. & N. O. Railway in connection with the extensions decided upon by the Ontario Government. The above order will be filled during the winter months and presumably will be for the Spring delivery. The business was placed with a view to relieving unemployment in the steel centres, and, taken in conjunction with the financial orders of other Canadiam railways, will make for a fair degree of activity for the winter months. It will be recalled that the Grand Trunk Railway System placed an order for 29,000 tons of rails to be divided between the two Canadian producers, and this in turn was preceded by another order from the Canadian National Railways and the C.P.R. Railway rolling stock repair work is furnishing additional employment. The Canadian National Railways is not purchasing new rolling stock this year but is seeking to bring track equipment up to a reasonable standard of efficiency.

St. John, N. B.—Considerable interest is manifested locally in the announcement that the New Brunswick Electric Power Commission has favored the construction of a transmission line from St. John to Moncton in order to enable the supply of 4,000 horsepower asked for by Moncton. It is understood that the government is agreeable to a survey for this line being made immediately and if St. John should decide to take all the current from the Musquash development, the government will commence the development of one unit on the lower falls of the Lepreau. It is felt that the requirements of Moncton, Sackville, Sussex and Hampton will make the development of the Lepreau necessary. In planning the transmission line from Musquash to St. John the hydro commission provided for the early development of the Lepreau by deciding upon a line sufficiently heavy to carry the current from both sites. While the initial expense was greater, it is said that it will effect quite a saving by obviating a second line for the carriage of the Lepreau current.

A firm in Paris, France, contemplates the importation of live lobsters from the Maritime Provinces of Canada. Before undertaking the project, however, they are investigating the practicability of taking the live crustaceans in tanks through the Gulf Stream. If it develops that the sudden changes in the temperature of the water will not prove injurious to the shellfish, it is the firm's intention to start shipments next year. If the scheme proves to be successful, it means that special carriers will have to be built, of twenty tons capacity. Next year, providing the scheme proves feasible, about six such loads will be taken from the east coast. The lobster is highly prized in France, and indeed, in every part of the world which is in a position to procure it.

IMPROVEMENT IN INDUSTRIAL AND COMMERCIAL CONDITIONS IN U.S.

CONTINUED improvement in industrial and commercial conditions is shown by figures just published by the Department of Commerce in its monthly "Survey of Current Business." Greater output of iron and steel, and of textile products is shown, while a widespread increase in building, stimulated to a large extent by the President's recent conference on unemployment, has made itself felt in lumber, cement, brick and related industries. The department notes further declines in prices during October, but on a much smaller scale than earlier in the year. This relative stability of prices and the improved banking situation, as evidenced by increased reserves, smaller loans and lower interest rates, are considered favorable to further business improvement. The most serious drawback is stated to be the low price of agricultural products and the consequent decreased buying power of the farmers.

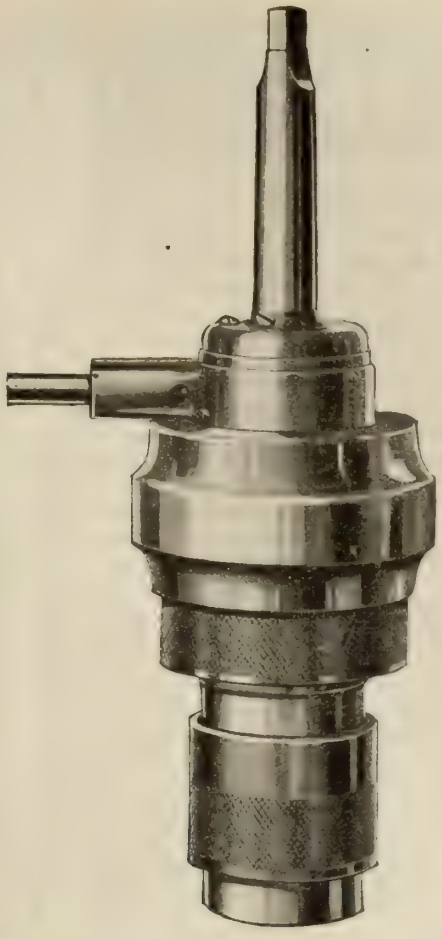
Production Increasing

Increased production was the general rule in October, as shown by figures in the "Survey." Substantial increases were reported in pig iron, steel, bituminous coal and coke, and smaller relative increases in cement, anthracite coal and wheat flour and in the consumption of cotton by mills. Zinc production remained stationary and petroleum production decreased slightly. Surprising results are shown by the comparison of the latest production figures with the low point of the year. This shows increases of about one-third over the minimum for pig iron, cotton manufactures, by-product coke, cigars, cigarettes, and manufactured tobacco, while bituminous coal output rose 70 per cent. from the minimum and the production of wheat flour, oleomararine, beehive coke, steel ingots, cement and wool products is about double the minimum figures. A small increase over the low point is noted for anthracite coal, while zinc, copper and petroleum are still close to the year's minimum production. Production of cigarettes and wheat flour exceeded even the highest point in 1920 and cement production was the largest ever recorded.

The "Survey" points out that, except for metals, the quantitative production of the important industries is as great or greater than before the war. Bituminous coal, petroleum, wheat flour, oleomargarine, cigarettes, cement, by-product coke and cotton and wool products are all greater than the 1913 average, while the output of anthracite coal, manufactured tobacco and cigars is very slightly less. With metal production only recently at its low point and the great recovery noted especially in iron and steel during the past two months, considerable progress is seen in putting this whole industry on the road to normal production.

Retail prices on November 1st showed no change, according to figures published, and wholesale prices declined slightly. Prices paid to producers for crops and livestock, however, still declined markedly and both groups are below the 1913 level for the first time since the beginning of the war, while wholesale and retail prices are still about 50 per cent above the mark. Wholesale prices in Canada, the United Kingdom and France also declined during October but continued inflation increased the price level in Germany and Italy.

Unemployment conditions continued to improve in October. Figures for the United States as a whole and for New York State show more men employed and larger payrolls, but average earnings appear to be on the decline. This factor is also reflected in the decline in Postal Savings. The small excess of immigration over emigration has also helped labor conditions. Increased buying is reflected by greater sales in October by mail-order houses, and chain stores, greater advertising in magazines and larger postal receipts.



The following paragraphs summarize the more important movements shown: Tertiles—Woollen mills were more active in October and imports of wool declined. Cotton consumption increased 2 per cen. and the ginnings exceeded the 2 per cent. and the ginnings exceeded the cotton and cotton cloth were the highest this year, the former being the largest since the beginning of 1920. Stocks of cotton were greater than a year ago. Substantial increases were shown in the October production of pig iron and steel ingots and a small increase occurred in iron and steel exports. Unfilled orders declined but structural steel sales were the largest since May, 1920. Copper and zinc production did not change materially. Production and exports of both bituminous and anthracite coal increased considerably in October. Consumption of petroleum rose to the highest point since January, but production declined. Imports and stocks, however, increased during the month.

Building costs declined and the value of business, residential and industrial building rose, the latter by 50 per cent. during the month. Residential building was twice as large as a year ago. Orders, production, shipments and exports of lumber were larger than in September. Shipments of bricks increased but production and stocks remained virtually unchanged. Cement production for October was the highest on record. Production of leather declined slightly in September but was larger than a year ago. Exports of leather increased in October but shoe exports declined. Imports of hides were also smaller. Increased traffic was noted in October through the Panama Canal and also through the Sault Ste. Marie Canal, but the tonnage of vessels in foreign trade entering and clearing from American ports declined. Ship construction continued to decline. The surplus of idle freight cars was cut in half during October, largely due to the threatened railroad strike, and car shortages increased, especially for coal cars. Bad order cars were reduced and total car loadings increased, especially coal and merchandise. Debits to individual accounts and bank clearings in New York City increased, but less activity was noted in the rest of the country. Further declines occurred in discounts and note circulation of the Federal Reserve. Business failures showed a large increase. Interest rates declined and increased activity was noted in the security markets. Declines occurred in new capital issues and in dividend and interest payments.

MORE POSTAGE NEEDED CAUSES SERIOUS DELAYS

Canadian manufacturers are requested to draw the attention of their mailing departments to the fact that considerable mail is being received in Japan with only sufficient stamps affixed thereon for domestic postage. While this has caused a great deal of delay and annoyance for some time past, in spite of repeated warnings from this office, it has now become a very serious item owing to the new International Postal rates recently established, which are much higher than the former rates. To give Canadian correspondents some idea of the delay and annoyance entailed through the carelessness of their mailing departments, continues the report, on the Empress mail alone, arriving this week the postage short on letters received for one day only (the Empress mail generally taking four or five days to thoroughly clean up in Japan) fines to the extent of Y1.60 were claimed by the Japenese postal authorities. As there are some ten or twelve large mail boats arriving here from Vancouver, Seattle and San Francisco every month, correspondents will readily understand that this negligence on their part involves a great deal of totally unnecessary expenditure which the Yokohama office has to defray. If such fines imposed are not sent in to the post office when the only and somewhat dilatory official in charge of the short postage department happens to be on duty (and his hours are very short), all such mail must lie in the post office until the following day, no matter how important it may happen to be. Therefore, continues the Yokohama office of the trade commissioner service they would be much obliged if Canadian manufacturers utilizing their service would render them every assistance in this direction, and would draw the attention of their mailing clerks to the fact that this office has the option of refusing mail on which sufficient postage has not been paid.

MAKE A TIME STUDY OF STOPPING AND STARTING YOUR DRILLING MACHINE TO CHANGE TOOLS

THEN COMPARE THE STEADY SAVING WHEN USING A JARVIS HIGH SPEED TAPPING DEVICE WITH QUICK CHANGE CHUCK.

With the ordinary equipment, the machine must be repeatedly brought to full stop in shifting tools, where there are a number of different operations in a radial drill or heavy duty drilling machine.

ALL THIS LOST TIME IS CONSERVED
BY THE JARVIS TAPPING DEVICES WITH QUICK CHANGE CHUCKS

Engine Cylinder Heads are drilled, tapped and studs set, while other parts are drilled, reamed, counterbored and tapped or spot-faced without a stop.
Jarvis Tapping Devices with Quick Change Chuck can be used on any Radial Drill job that calls for tapping or stud setting. One manufacturer taps a number of different size holes in a wall-radial drill without stopping the machine.
Different style devices fit them particularly for the requirements of the work in hand.

Style S is arranged for heavy work, such as Engine and Motor Castings, Machinery and Automobile Parts
Sometimes a job requires a positive drive with no reverse. Then the Jarvis Style R Device, with Locking Ring, is Used

Any standard Jarvis Product will be sent on trial to Reliable Concerns.
Jarvis High Speed Tapping Devices and Quick Change Chucks and Collets are carried solely by the Geometric Tool Company.

SIMONDS
Hack Saws

Don't experiment with Hack Saw Blades. Select Simonds and you will save money and time.

These blades have been tested and proved the highest grade for machine shop use. They have the steel quality that holds a cutting edge and are non-breaking. Thousands are used throughout Canada.

MONTREAL LETTER

(Continued from page 36)

but steady reduction. Prospects for the business in the New Year are very bright. The non-ferrous metals all present a very firm tone. No actual rise in the price of copper has been quoted, but it is extremely difficult to obtain any great supply of the metal. Should any increase in demand occur early in the year, there will be a sharp rise in price and more or less acute shortage. Some jobbers are picking up a little copper for stock purposes and this may have the result of forcing up the price or at least maintaining the stiff tone.

Tin is another cent and a half, for no apparent reason unless that of sympathy with the all around strong tone in the prices of other metals. New York and London markets in non-ferrous metals are strong and have been so for over two weeks. Local prices went up in sympathy, although the volume of local business has not increased to any extent. The rise in sterling also contributed to the stiff tone. No great increase in local trading is looked for before the New Year. The scrap market still remains extremely quiet. No actual reports of business have been received and quotations are neither asked for nor given. As far as attention to this department of the metal business is concerned, the only activity is, that of those interested, in endeavoring to obtain lower freight rates.

MEASURING ONE THOUSANDTH OF A SECOND

Part of the work of an observatory depends upon a means of measuring extremely short periods of time. For example, in receiving any signal by wireless telegraph or otherwise, it is vitally important that the precise time of receipt as recorded by a clock should be known. In order to facilitate this highly accurate determination, a British observatory has developed an appliance based on the Oscillograph, itself a British invention. This apparatus can register clocks' times of any signal accurately within one thousandth part of a second.

MEETING AN EMERGENCY

The Canadian Brakeshoe Co. of Sherbrooke received a carload of 5,000 gallons of fuel oil which after unloading proved incorrect for their needs. The proposition that confronted them was the pumping of the oil from their tank up into the car, which meant a lift of from 22 to 25 feet and the only machine available was a gear pump rated at 10 gallons per minute.

Hand pumping meant the erection of a suitable platform on which to set the pump and the time of two men to operate it costing at least $20. Not considering demurrage charges on the car. Their master mechanic while erecting the platform thought of using a Little David drill which they had, and connected it by setting a set screw chuck to the spindle of the pump. The pump and drill were connected up and started at 10.15 a.m. and the job was completed at 6 p.m. the drill running continuously without an attendant, thus saving some $15.00 in labor without considering the possible demurrage charges. The same concern used a pneumatic drill for powerizing a hand crane used for lifting ladles in front of their electric furnace, thus proving they are equal to emergencies.

OBITUARY

Thomas Findley, president of the Massey-Harris Co., died a few days before our going to press. Mr. Findley has been in poor health lately, in fact, some five years ago, sought medical attention and advice, but without the success he wished for. Some five weeks ago, he was compelled to discontinue his daily duties and this went especially hard with him, as he was only in his 52nd year.

Starting as a farm boy, Mr. Findley worked his way up to not only riches but outstanding influence. He had a international reputation as a financier and business man, and at the time of his death was president of the Massey-Harris Co., director of the Johnston Harvester Co., vice-president of the Toronto Housing Co., director of the National Trust Co., director of the Verity Plow Co., and president of the Bain Waggon Co. He has always had the interest of the workmen at heart, having himself passed through the school of experience.

Classified Opportunities

Modern Marine Machinery

Automatic Steam Towing Machines, Ship Windlasses, Cargo and Deck Winches, Steam Capstans, Dock Gypsies, Steering Engines, Hydraulic Freight Hoists, etc. Grey Iron and Brass Castings. Special machinery built to order. The Corbet Foundry & Machine Co., Limited, Owen Sound, Ont. (52)

SPACE WANTED

FLOOR SPACE — SEPARATE ENTRANCE— Suitable for machine shop or light manufacturing, with power, reasonable rental with long lease if desired; also small foundry building, suitable for 4 to 6 moulders; in good manufacturing town; railway centre. Apply Box 789T, Canadian Machinery.

HELP WANTED

WANTED AT ONCE — THOROUGHLY COMpetent mechanic of good character and judgment, to take charge of production in a modern plant manufacturing automatic screw machine products. Must be thoroughly conversant with up-to-the-minute methods of producing on automatics and finishing by secondary operations both high-grade and commercial products, with a complete knowledge of tools, and tool designs best adapted to get these results. Must be able to train and handle help, enthusing them by personal leadership and energy so that efficiency can be constantly maintained. To a thorough mechanic who has a capacity for geting things done, this is a real opportunity. In applying state age, nationality, experience, and lowest salary expected as a start. Plant is up-to-the-minute in modern equipment. The Galt Machine Screw Co., Limited, Galt, Ontario, Canada.

FACTORIES FOR SALE — TWO DESIRABLE plants; one at Mount Forest, constructed of brick, floorage over 40,000 square feet, formerly operated by Weir Wardrobe Co.; and the other at Guelph, stone florage over 50,000 square feet, formerly operated by Dominion Casket Co. Apply Box 777G, Canadian Machinery.

CANADIAN PATENT ON OPERA CHAIR — spring, which automatically raises seat; can be manufactured at low cost and show big profit; now installed in some of best theatres in Toronto; every theatre, from smallest to largest capacity, a likely purchaser; will sell outright or for cash and royalty basis. Box 777T, Canadian Machinery.

Machinery Wanted

Advertisements under this heading will be inserted once free of charge. Readers are invited to use this department when in need of equipment. Replies may be sent to box number, care of Canadian Machinery, if desired.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

One of our prominent advertisers writes:

"We hear you are getting out the 1921 'Annual Review Number' of CANADIAN MACHINERY. In our opinion this number is very useful to the Engineering World of Canada, and we think you should be encouraged to extend your editorial services as well as the publishing of special articles on timely subjects.

"In our opinion the future of industrial Canada is such as to warrant manufacturers in making ample preparation for big production in days which are not far distant. The experience of Henry Ford, and other manufacturers has shown that there is room for wonderful economies in production organization and machinery. We wish you every success in your 'Annual Number.'"

Know our Costs as well as your own

A FEW months ago the Lincoln Electric Company of Canada made a rather unusual announcement to the readers of Canadian Machinery.

This offer which is being received and acclaimed on all sides was to the effect that Lincoln Sales Engineers are not talking electric welding these days so much as they are advocating close checking of welding costs.

What One Canadian Manufacturer Found

For instance, one Canadian manufacturer who stated that he was doing some oxy-acetylene welding, as well as a considerable amount of riveting on tanks, is now checking up his costs on this work and has definitely decided that he will send his next job to our shops in Toronto, along with his superintendent, so that he may know exactly the electric welding cost on his class of work. He had been in the habit of bidding on many jobs that he had not secured. He wanted repeat orders and he was looking to the future. He saw very quickly that it was up to him, in these, his slack times to **know** the costs.

Completes Cost Finding Buys Lincoln Welder

"One well known concern has already completed its cost finding" states Mr. George Bertram, the Lincoln Sales Manager. "It is now using a Lincoln Welder recently purchased, instead of oxy-acetylene. Another Manufacturer has also investigated the Lincoln methods and finds that they would save him money. He is, therefore about to close for the purchase of a Lincoln Welder."

"Two other manufacturing concerns in Ontario have work in our shops this minute awaiting the arrival of their engineers who are going to check their own costs with ours."

Sends Work For Test

Mr. Bertram also handed us a letter dated December 7th, from a prominent firm which states— ".....we are shipping a piece of work and we would like to have test made as soon as possible as we are now tendering on a new order."

Know These Things For Yourself

On all sides our plan is being approved and many are preparing to take advantage of it, so that they may secure actual costs on electric welding —using a Lincoln Arc Welder—thereby securing the lowest possible costs. Our own experience proves that 20 per cent. greater speed can be secured by the use of the Lincoln Arc Welder over that of any other electric welder now manufactured.

If you have never investigated Lincoln welding you are especially invited to do so now. Many superintendents, shop foremen and engineers have visited our plant in the last few months and examined our costs on their particular jobs.

The Lincoln Electric Company of Canada, Limited, Head Office and Works: 136 John Street, Toronto, 'Phone Adelaide 7200. Montreal Office: Coristine Bldg.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the wide-spread desire throughout the Dominion that there should be obtained in Canada, with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they have completed extensive alterations and additions to their rolling mills, and are ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15″, all standard sections of ANGLES from 6″ x 6″ down to 1¼″, ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process, and can be furnished in all grades from the softest rivet stocks to high carbon special spring material.

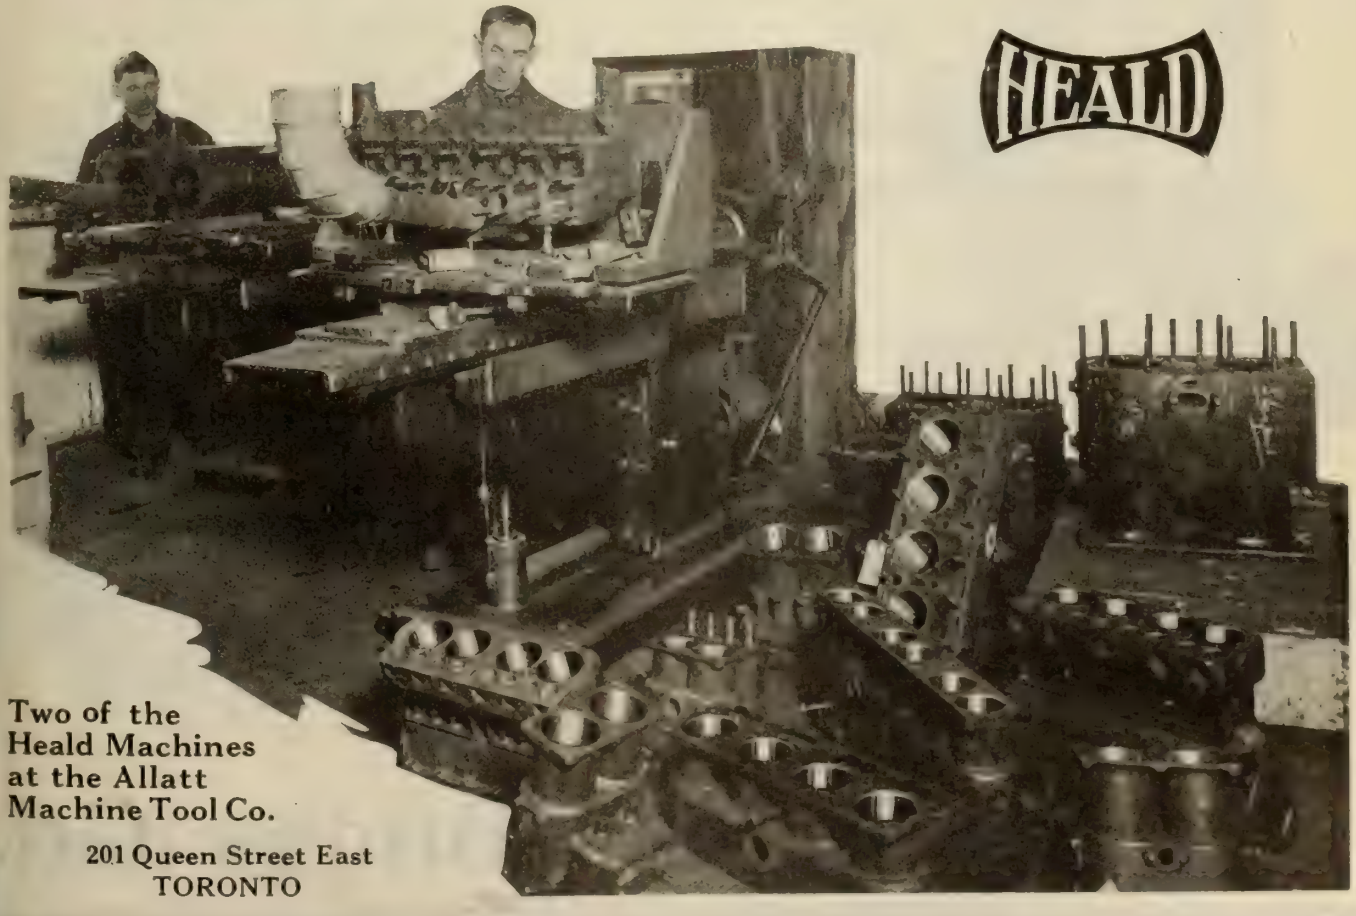
If interested tear out this page and place with letters to be answered.

How Can I Cure My "Motor Troubles?"

is the question that is being asked garages and repair shops by automobile owners. There is a good reason for this as the automobilist knows that the cylinders are the heart of the motor and that unless they function properly it is useless to overhaul and groom the car for next spring's opening.

Ground cylinders save gas and oil, they increase the power, and give a good many more miles per dollar expense. At this time such economy appeals to the owners of both low and high priced cars.

Motor owners neglect this work owing to the inconvenience of not having a shop handy that is equipped to take care of it. It is high grade work, commands high prices, and has been a life-saver for many during the business depression.



Most small machine and repair shops are already equipped with everything except a Heald Cylinder Grinding Machine. We can offer you two styles—No. 55, which is simple, self-contained, with a large range and at a nominal price. This machine is being used by a large number of those just starting in the regrinding business. The style No. 65 is much heavier, with extra speeds and feeds and when equipped with our universal jig is ideal for regrinding work.

Either style is a safe bet. Let us send you literature, or better still, have a representative call

SPECIAL FORGINGS

A Variety of Intricate Shapes Impossible with any other Machine

INCLUDING within their range all kinds of bolts and forgings that are possible on Forging Machines, Acme Forging Machines are capable of intricate shapes **not possible** on ordinary types. Acme machines are universal because bolts and forgings are made with equal facility by exactly the same mechanical movements. This is a distinctive feature.

Note the powerful, simple and efficient construction of the 2½-inch All Steel Heading, Upsetting and Forging Machine shown below. It may be used in continuous or intermittent motion.

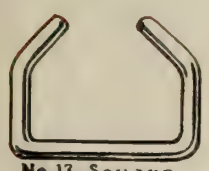
Torrington

MACHINE SCREWS

Standard and Special Machine Screws, Rivets, Threaded Wire and Specialties



WE KNOW what Torrington Machine Screws have done in the past and are doing to-day—and we know all that is necessary to convince you that they are superior to the screws you are now using is to put them to brief, comparative test. Shall we send you samples? In addition to our well-known machine screws we make high-grade Rivets from Brass, Copper, Steel, German Silver and Aluminum; also Threaded Wires and specialties in various kinds of Headed Work.

Save Expense!

If you are making parts on screw machines we would advise you to investigate the cost of production. Then send us a sample or blue print of the work, and we will then submit an estimate of our cost to supply them to you. By our process we can produce them at a considerable lower cost—the benefit of which will accrue to you.

Bear in mind, when you buy **Torrington** products you have complete choice of standard makes to choose from, and when special parts are required the **Torrington** factory has adequate facilities for producing all manner of work quickly and economically. **How may we serve you?**

Torrington Belt Hooks

No 13 Square

Another of our products that has made good. Torrington Belt Hooks are stronger and last longer than ordinary hooks. Don't merely say "Belt Hooks" in your order—specify "Torrington." How may we serve you?

FORD-SMITH

Cutting Shop Costs with a

No. 4 Plain Miller

Are you getting the most from your milling operations? Isn't t a proper time to make sure your costs are down to a rock-bottom bas Won't you let us send you production figures with a Ford-Smith N Miller on work similar to your own? You will find that the many c venient features such as the dial-feed hand wheel, location of the f box, etc., are big assets to the operator in getting out more work hour.

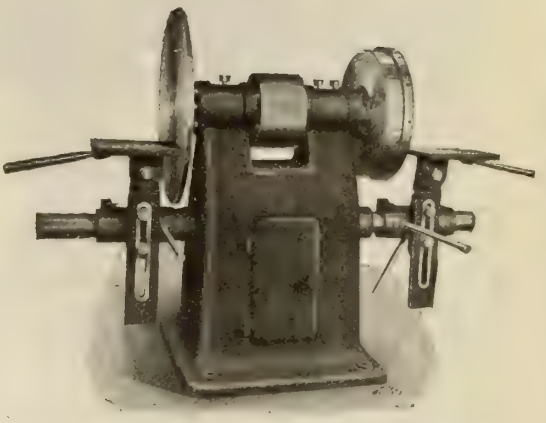
Cone Drive

Wide Range — Rapid Po

The new arrangement of dial-feed hand-wheel g twelve changes of feed. in conjunction with the c feed handle at the front of umns gives 24 changes the back gear is in. Thro out the entire constru rigidity is the keynote and is backed up by plenty power, speed and unfailing curacy. Thoroughly test absolutely guaranteed.

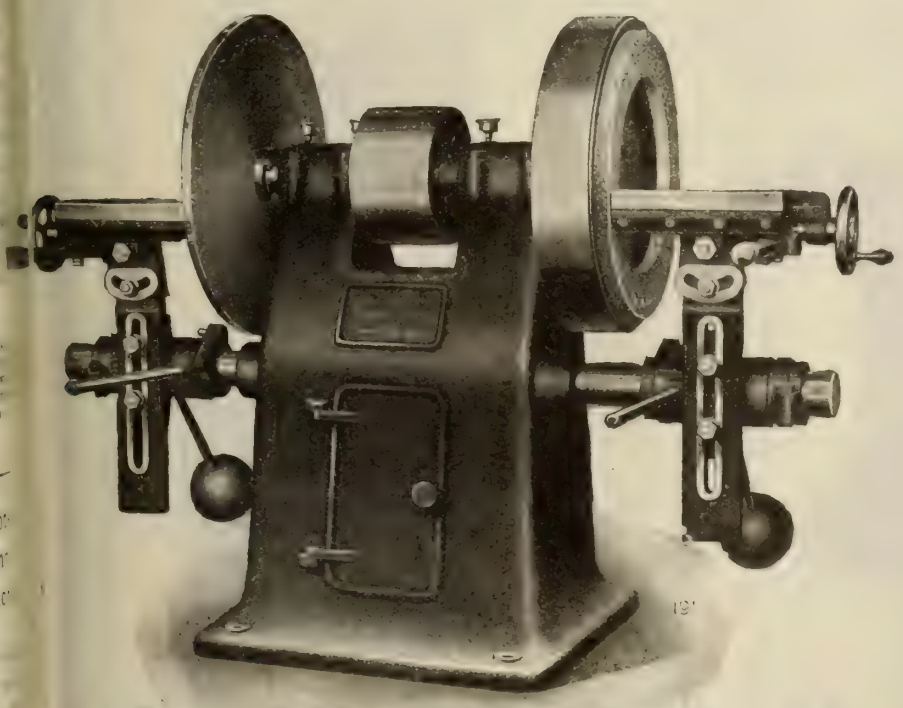
The Ford-Smith No. 4 Mille is fully described in our lat est catalogue. You will fin in it worth-while facts abou milling. Ask for a copy.

Let us Quote on Dies and Special Machine



We design or build ma chines from your ow specifications. Our f cilities enable us t make dies as large a eight tons. Have ou engineers co-operate.

If interested tear out this page and place with letters to be answered.

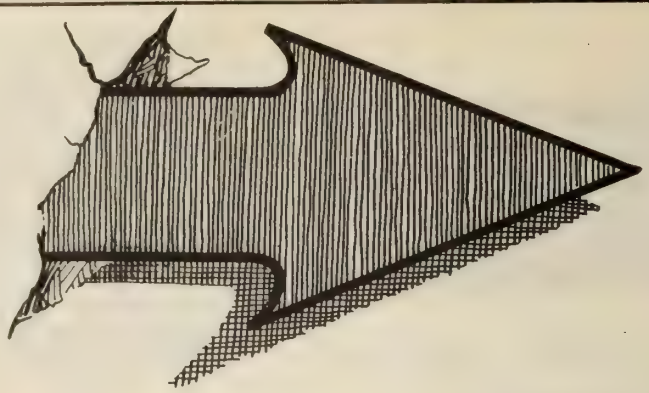


FORD-SMITH

Increasing Shop Turnout with these
Production Grinders

The point that we have been trying to drive home to you ever since we designed this type is the fact that Ford-Smith Production Grinders make possible **more turnout** at **much lower cost.** They have the power and the range to handle much of the work that costs more money to have done on a larger machine tool. They save wages because they can be operated by unskilled help. Built in essential features and equipped with inexpensive workholders.

All Ford-Smith Grinders are equipped with work holders and other convenient features that enable the operator to make all his time count.



HERE is another fact that's worth remembering. Ford-Smith Production Grinders are **not** expensive machines. In first cost they demand only a modest investment. And after that **nothing!** Strong and sturdily constructed they seldom require adjustments under normal conditions. Thoroughly tested before leaving the factory.

We are now on the rising curve to increased prosperity. 1922 has fitting rewards for the man who steps in with both feet. Ford-Smith Grinders will help you. Ask for catalogue.

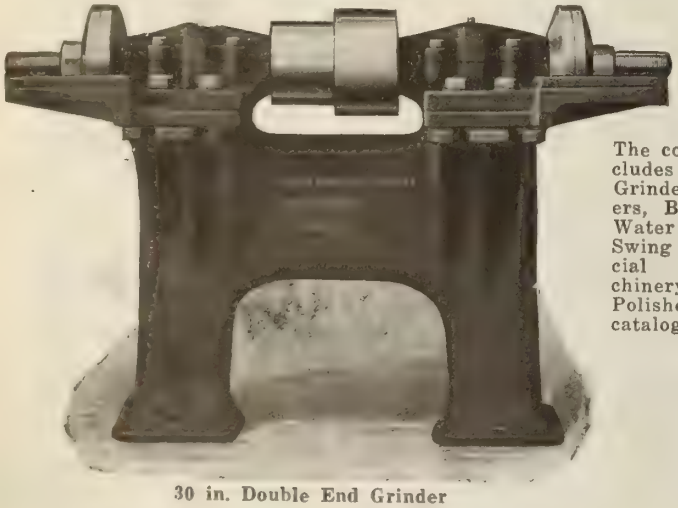
FORD-SMITH



Types

For Getting Volume Production

IT ISN'T an easy task to invest in new equipment in these days when high manufacturing costs shake hands with low selling costs. Yet consider what Ford-Smith Grinding and Polishing Equipment will really accomplish for you.

These machines fill a very important niche in manufacturing operations. Castings, forgings, in fact everything requiring fine finish or size reduction are quickly handled. Bigger turnout pays their cost in short order.

These grinding and polishing machines are designed from the standpoint of **strength, sturdiness, stability** that enables them to meet present day conditions and show a profit.

GOODELL-PRATT

1500 GOOD TOOLS

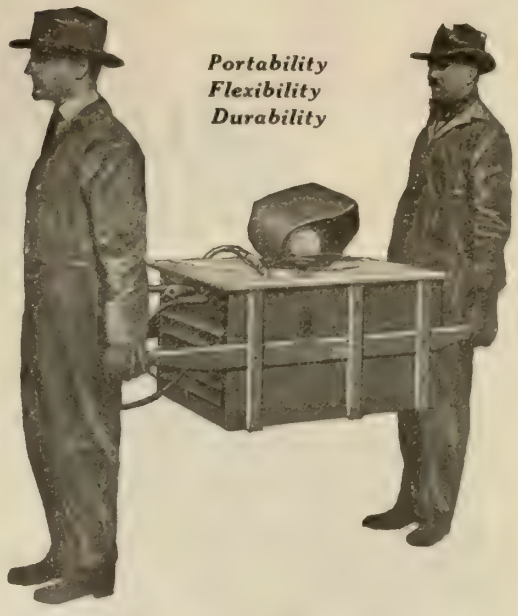
DON'T TAKE ANYBODY'S WORD FOR IT—

Find Out For Yourself.

We believe that we are making the most accurate line of machinists' tools now on the market. But we don't ask you to believe us.

All we ask is that you thoroughly test Goodell-Pratt tools and find out for yourself. Tests that you can make yourself under your own working conditions will convince you more thoroughly than anything that we can do or say.

Whether it is a Micrometer, a Depth Gauge, a Steel Rule, a Square, or any other precision tool, we will stand squarely back of the materials and workmanship, and we guarantee the accuracy. The finish you can readily see for yourself, and the serviceability you will find out after years of use.



Ask your dealer, or write for "Tools for the Toolmaker"

Williams

TO obtain and maintain, a world-wide distribution of any commodity, it must possess extraordinary features. If it's a machine tool, it must possess features which lift it out of the ordinary class; it must be a rapid and efficient producer of work. Williams Pipe Threading Machine has a universal distribution. It has features possessed by no other lathe of its kind. That's why "Williams Goes Abroad."

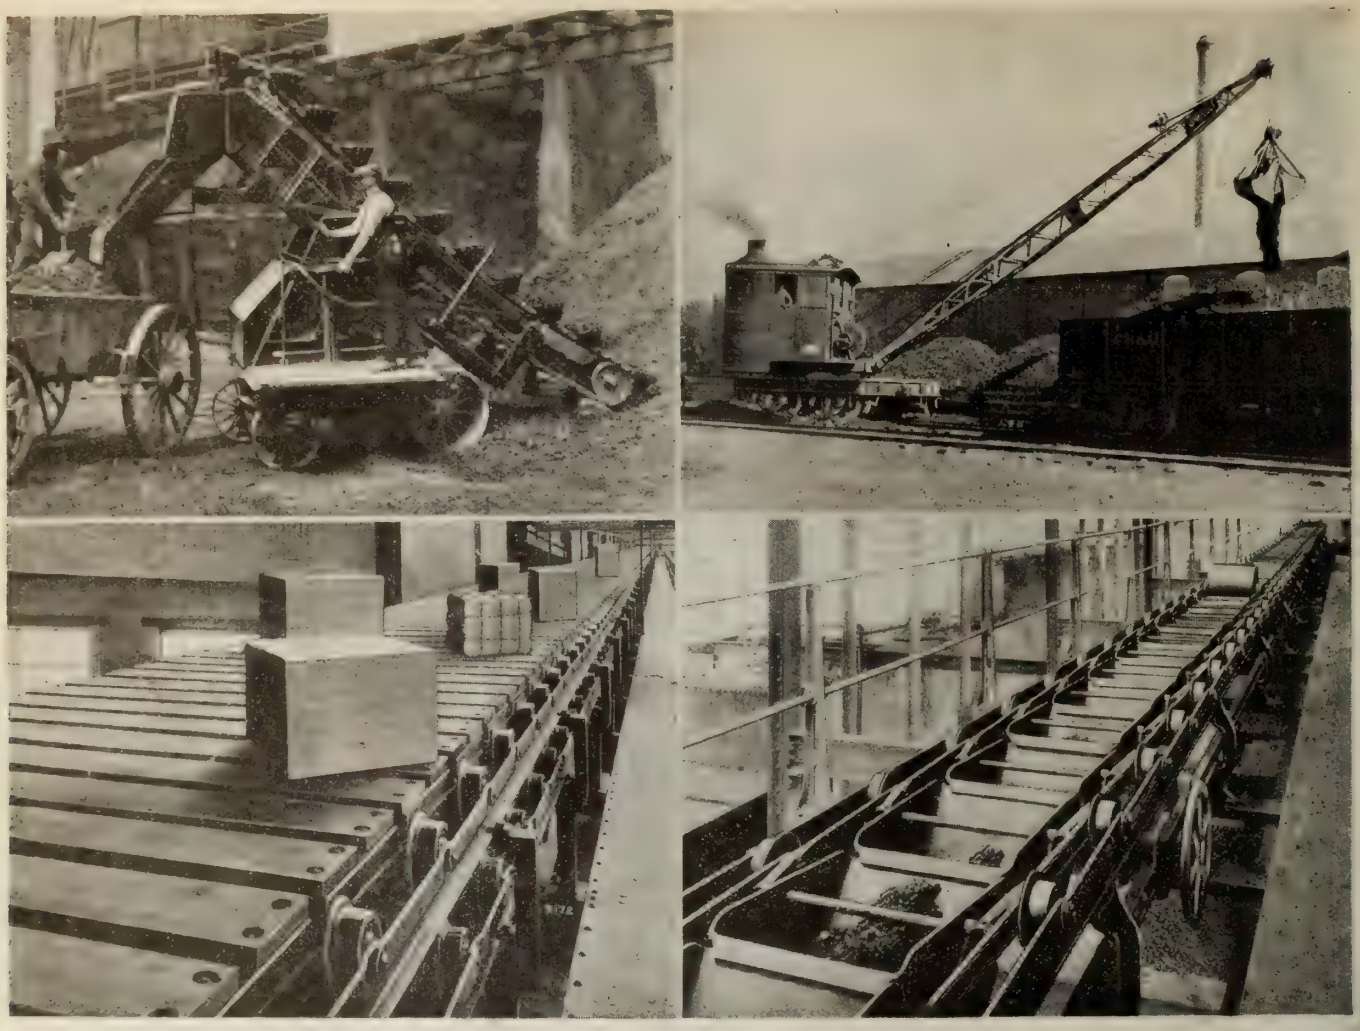
A recent shipment was a Williams 16″ machine to the Central Lafayette, Porto Rico and an 8″ and a 4″ to Fortaleza, Ceara for the Chilean Government. These Williams, like many others, are making the trip to cut and thread pipe better, quicker and at lower cost.

WILLIAMS TOOL CORPORATION of CANADA LIMITED

Successors to John H. Hall & Sons, Ltd. Brantford, Ont.

If interested tear out this page and place with letters to be answered.

Goes Abroad



Williams Pipe Machines today combine all the outstanding features of the famous Canadian **Hall** Pipe Machines and **Williams** Pipe Machines, the foremost of their kind in the United States.

These features in a nutshell include: single pulley drive; special swivel reaming tool and post; compact control lever on operator's side; quick change—eight speeds; hand wheel on rear chuck; large spindle and spindle bearing; extra large oil trough —no dripping over; special overflow valve; rotary pump, reversible L.H.; all racks and gears machine-cut; specially constructed reservoir and filter; and all gears are amply protected. There are many other points to be considered by the discriminating buyer; our catalog explains them—may we send it to you?

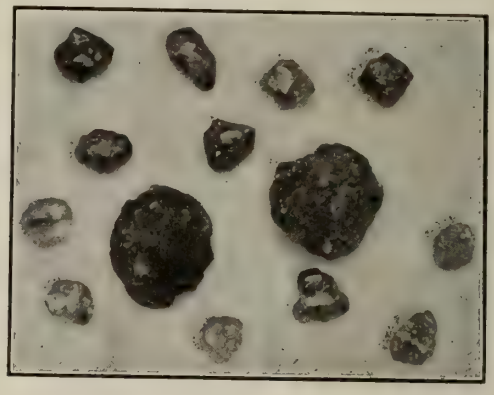
OPERATED IN CONJUNCTION WITH A CONTINENT WIDE NET-WORK OF DISTRIBUTION STATIONS

"Liquid Air" Oxygen Means a Saving in Transportation

With a network of Factories not only planned, but in actual operation, and a number of Distribution Stations situated at all large centres all over Canada, Purchasers of Oxygen can obtain their supplies at a point very near to the point of consumption. This completely obviates heavy freight charges on cylinders and assures an immediate supply at any time within a few hours and even minutes after the orders are placed.

All cylinders conform to the specifications of the Canadian Railroad Board and are made to ensure safety without unnecessary weight. When purchasing "Liquid Air" Oxygen you not only save on freight, but in very many cases this expense is almost eliminated.

There Are Diamonds - and Diamonds



THE South African diamonds which are used in Mechanics come out of the same mines that milady's solitaires and sunbursts do. These industrial diamonds possess all the qualities of the decorative ones except brilliancy. In addition there is the carbon or black diamond found only in Brazil, which is as much of a diamond as the gem itself except that it appears in non-crystaline form.

Although these industrial diamonds are but five per cent. of the output they are inestimably more essential than all the others combined.

There is nothing to take the place of the industrial diamond. Its hardness is unapproached by any other known substance. But, like anything else which comes out of the earth it is found in varying grades.

Only experts can tell the grade of a diamond. Only experts of long experience know what kind and size of diamond should be used for particular industrial uses. You should not chance a purchase on such costly equipment. The Wheel Trueing Tool Company has established an impregnable reputation for integrity in its twelve years of diamond importing and diamond tool manufacture. If you do business with this house you are guaranteed the exact stone for the job, you are assured of the most reliable service in keeping your diamonds and diamond tools in perfect condition and you are given, free of charge, a cost-keeping system which will permit you to secure minimum cost per dressing.

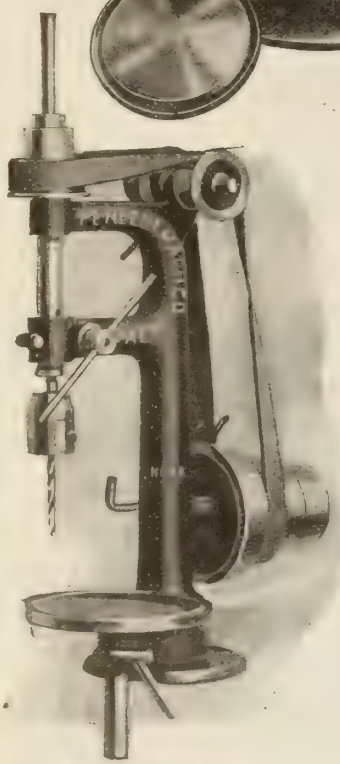
"Perfect"

20 "Perfect" Lathes for the Toronto Technical Schools



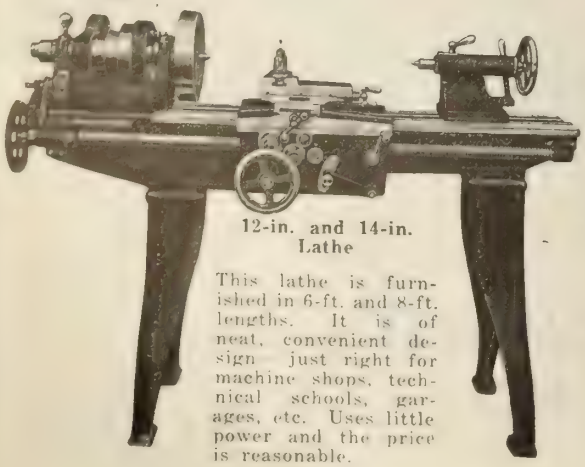
THIS is convincing evidence that "Perfect" machines are living up to their name. It was not without a widespread and thorough investigation that the Toronto Technical School Board decided in favor of using "Perfect" lathes for teaching students to become first-class mechanics. "Perfect" tools for perfect mechanics! "Perfect" lathes were chosen because they embody the most modern principles in design, because they are always carefully built and bear a splendid reputation in the best shops in Canada.

What is true of "Perfect" Lathes is true of "Perfect" Drills, Hack Saw Machines, Drill Presses and other machine tools.

No. 19 Drill

Perfect No. 19 Drill, geared 2 to 1, is driven by a 2-in. belt; has lots of power; handles a drill from 0 to 29/32. Its value is shown when compared with other 18 x 20-in. drills.

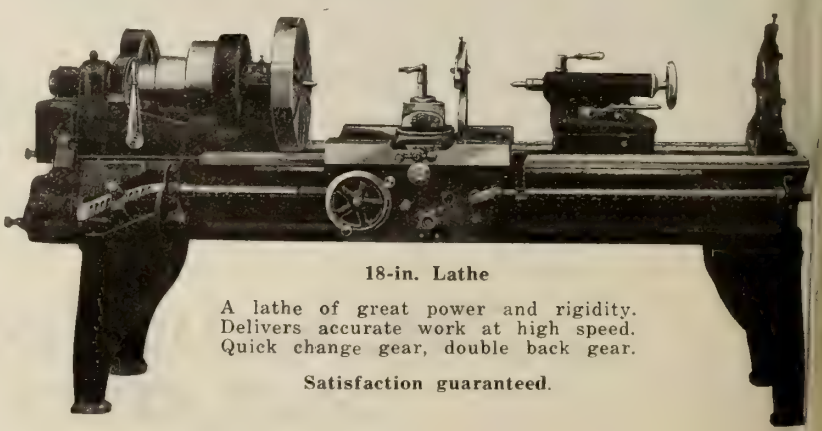
No. 18 Drill



This drill combines efficiency, accuracy, durability and convenience of operation.

Drills to centre of 10 in. Speed 2,500 R.P.M.

Perfect Machine Co., Limited



Galt, Ontario, Canada

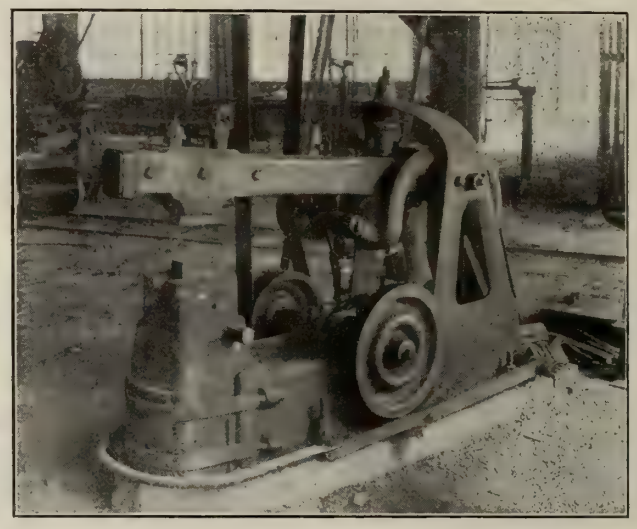
JOSEPH T. RYERSON & SON



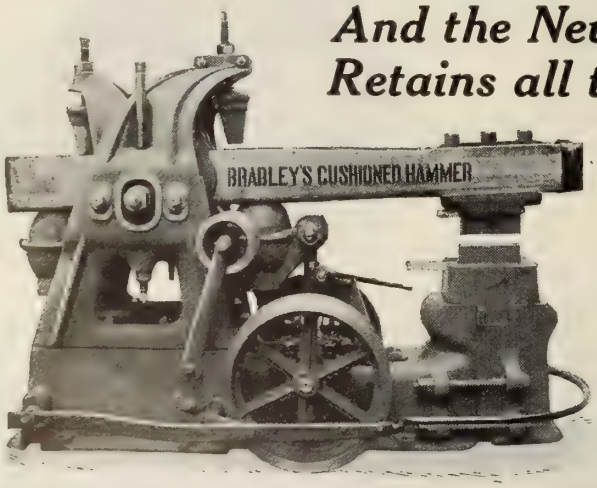
Established 1842 Incorporated 1888

CHICAGO ST. LOUIS DETROIT BUFFALO NEW YORK

Nearly Fifty Years of Strenuous Service

For this BRADLEY HAMMER

--*And it is Working Fine To-day!*



Here is one of the first Bradley Hammers ever built. This 1921 photograph shows it as it looks to-day, still going strong.

On October the 24th, way back in 1872—49 years ago to be exact—this Forty pound (Head Weight) No. 7 Bradley Hammer was sold to the Silsby Mfg. Co., Seneca Falls, N.Y. It was used in the Silsby plant for twenty-two years and then sold to the Syracuse Silver Metal Company in 1894. After being used for eleven years in the Syracuse Silver Metal Company, Smith and Caffery of Syracuse paid $50 and purchased the hammer for junk.

To their intense surprise Smith and Caffery found there was still life in the old soldier so instead of scrapping it they belted it up—and there it has been on the job every working day for almost seventeen years.

Over forty-nine years on the job and still going strong is some record for any piece of forging machinery. It clearly illustrates the remarkable durability built into all Bradley Hammers.

And the New Type Bradley Retains all the Quality of 49 Years Ago

The Modern Bradley Rubber Cushioned Helve Hammer.

Here is our modern Rubber Cushioned Helve Hammer—a type capable of the same performance as the old pioneer above but having many improvements. It has facilities for instantly changing the length of stroke. Compared with any other hammer the results show less power used, less repairs required, larger capacity and greater adaptability.

Write for circulars describing the four types of Bradley Hammers.

GARVIN

Dependable!

Used the world over for 50 years

The expert hand of the "old timer" can probably coax good results out of the ordinary machine tool—if you give him time.

With a Garvin he gets results instinctively and by previous training, and with a speed that weighs well against overhead.

The "comer" can pin his faith to a Garvin. Garvin Machines quickly brush all doubt away. Their unfailing performance will make the new man as proud of h's work and as proud of his speed and quality records as any Garvin user ever was.

Let us tell you the technical reasons why. Ask for the Garvin Catalog now.

The Garvin MACHINE COMPANY

Spring and Varick Streets

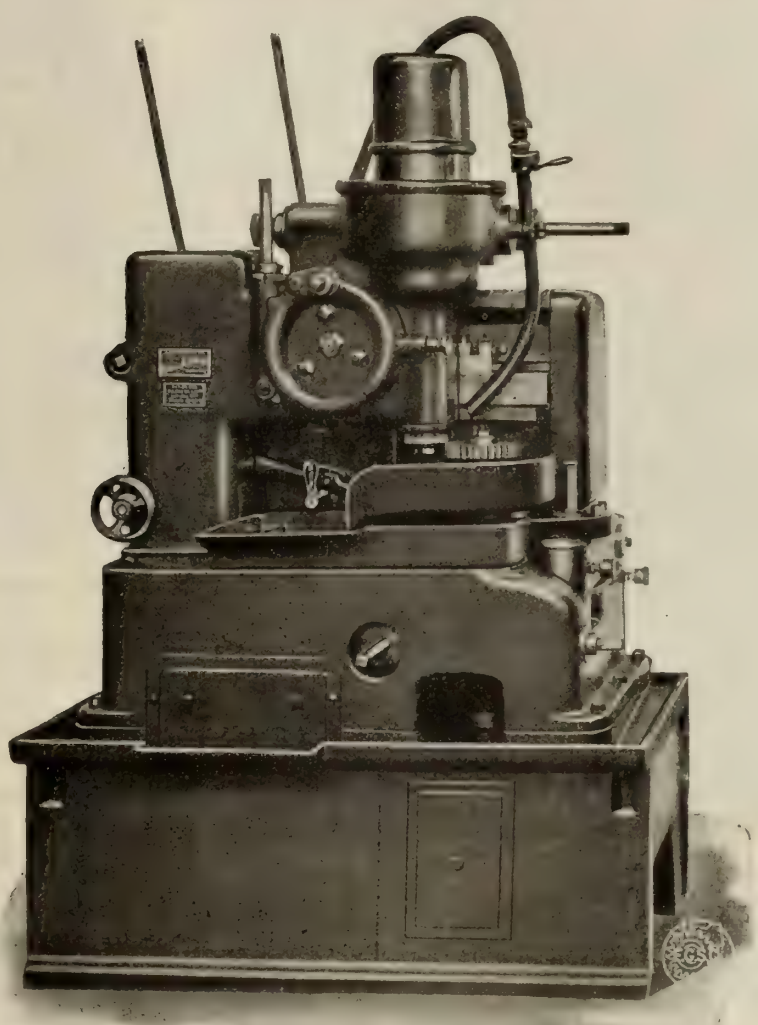
New York, N.Y.

THE Machine Shop operator has learned by experience to depend on Garvin Machines for all kinds of work.

He knows Garvin Milling Machines, Screw Machines, Tappers, Lathes, Slotters, Duplex Drills and Millers, Profilers, Cam Cutters, etc.

It is not a matter of **learning** about them—if he knows anything about shop equipment he **knows** Garvin.

Garvin builds—



- Arbors
- Attachments—

GARVIN

BUILDER OF BETTER MACHINE TOOLS

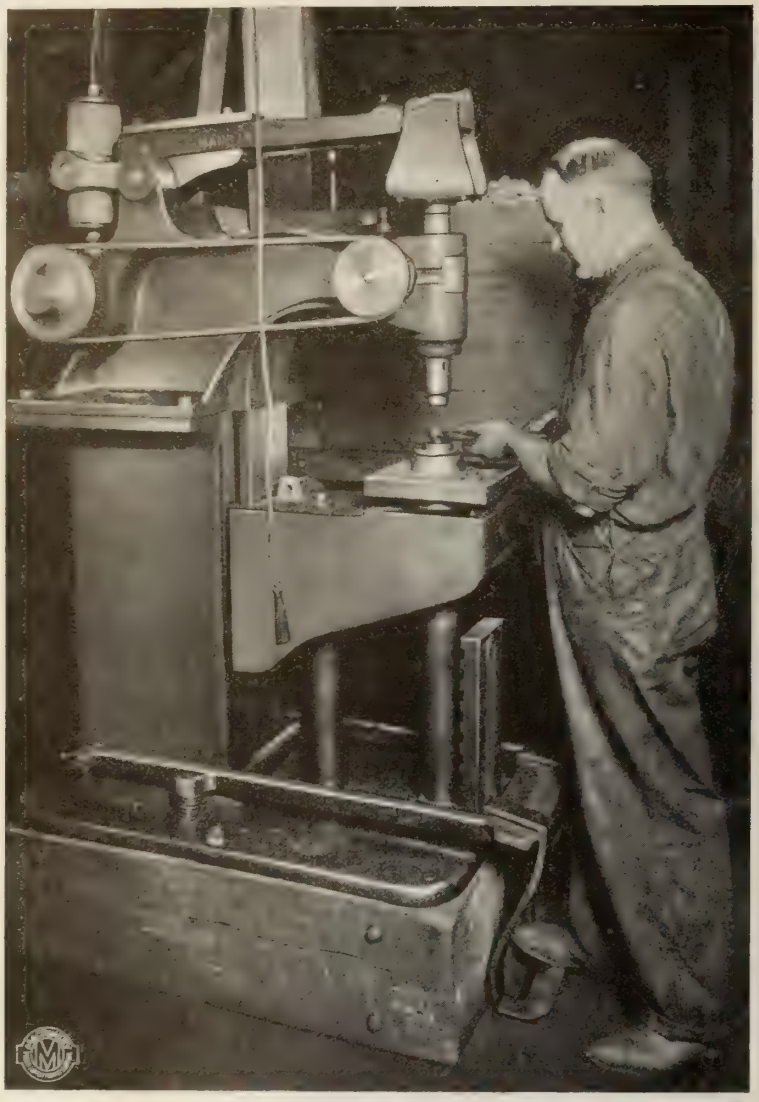
CUT GEAR COSTS
WITH THE
New Production Gear Shaper

The new production Gear Shaper, illustrated, has been designed to cut gear costs. It incorporates every feature necessary in a gear cutting machine to obtain this result, and still one of the outstanding features of the Gear Shaper principle—accuracy—has been maintained.

It is designed to cut one gear at a time and at a speed which eclipses all other methods.

All operating levers are at the front of the machine, permitting a number to be bolted together and operated as a unit, one 6 H.P. motor furnishing ample power for 10 machines.

It incorporates to the fullest extent the three principal requirements of production—high speed, accuracy and simplicity of operation.



See illustrated article in all technical magazines.

Send for our booklet, "A New Development in Gear Cutting," which has been prepared for the benefit of Engineers and Production Managers interested in the best gear cutting equipment available.

Write for your copy now.

High Speed

A No. 6-B HIGH SPEED RIVETING HAMMER

(PATENTED)

Latest Product of the High Speed Hammer Company

THE New No. 6B High Speed Riveting Hammer is shown here riveting a nickel-steel ball to a forged steel pitman arm in a branch plant of the General Motors Corporation, where the famous "Jacox" steering gear is made. It has proved one of the most efficient production units in the whole works.

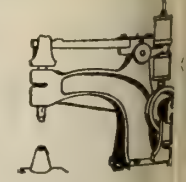
The nickel steel ball in this operation has a 5/8" shank and is pressed into the arm by an arbor press. About 1/8 in. stock is left to rivet and the machine turns the head over to 3/4 in. diameter.

A Record Made

On a 5-hour test run the remarkable production of 2,200 was obtained.

The No. 6-B Hammer is specially designed for heavy, cold riveting. Its capacity is full round heads on 5/8 in. to 3/4 in. stock; oval or flush heads, 7/8 in. to 1-1/2 in. stock.

Send us samples of your work and let us demonstrate our process of cold riveting on your own product.



A Separate View of the Parts

THE PRINCIPLE IS RIGHT

THE HAMMER WITH THE HUMAN STROKE

Riveting Hammers

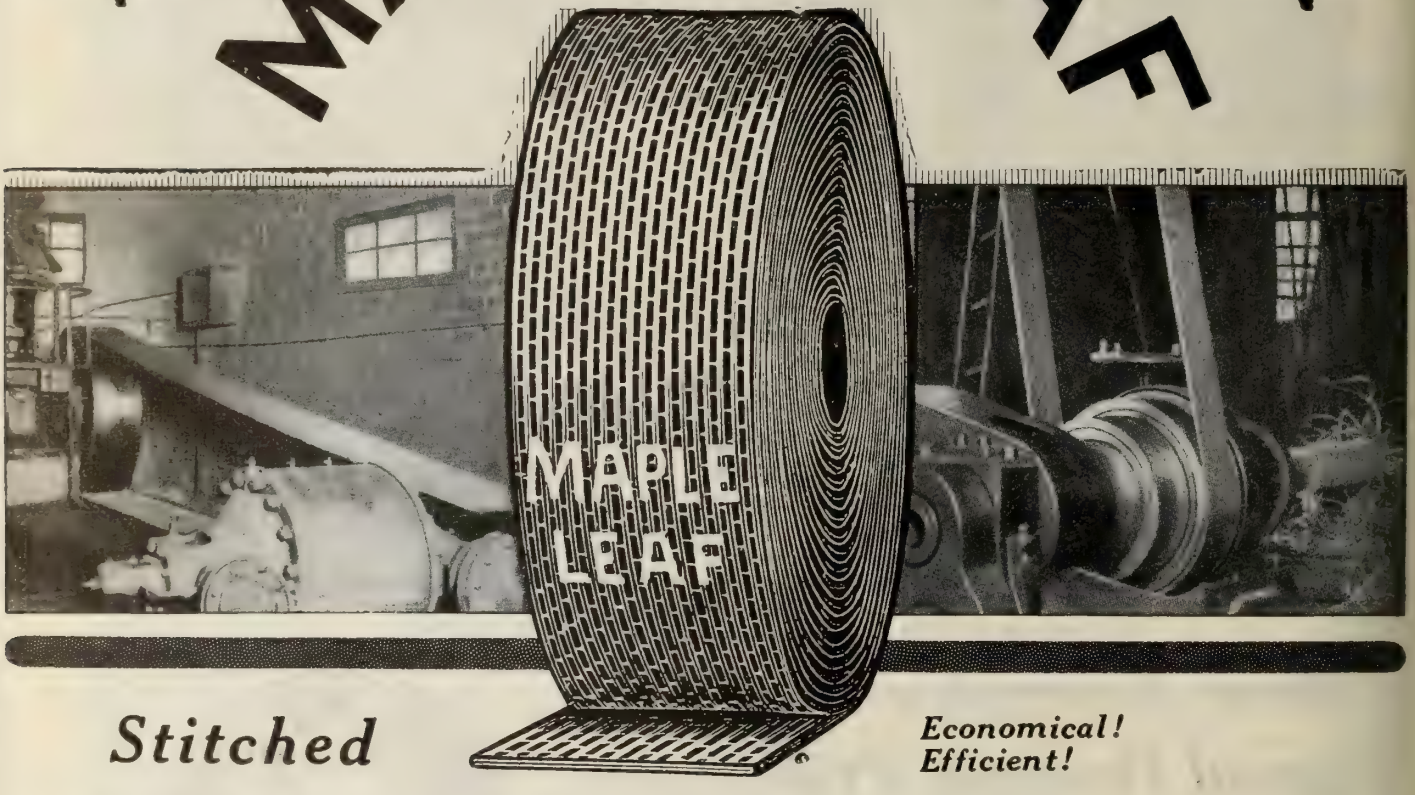
A Battery of 3 No. 5 A, High Speed Riveting Hammers

More Examples of High Speed Hammer Production

PRODUCTION of parts on a quantity and quality basis makes the Chevrolet Automobile possible as a popular priced car.

High speed Riveting Hammers play an important part in the production of the famous Chevrolet.

The example illustrated shows a battery of 3 No. 5A High Speed Riveting Hammers on the riveting of three bosses to brake flange plates: sheet steel stampings 1-8" in thickness. Two of the bosses are of cold rolled steel, and are 7-8" diameter, the third being a square. Each High Speed Hammer shown performs one operation, and in this way the very excellent production of 300 for each hammer of these large riveted bosses per hour is obtained.



If you have riveting to do in quantities you can secure similar results. By sending sample parts to us for riveting and by getting our estimates you can prove the truth of this statement.

MAPLE LEAF BRAND

Stitched

Economical!
Efficient!

Cotton Duck Belting

Cost Less Than Leather, Rubber or Balata

FOR transmission of power or conveying purposes, Maple Leaf Brand Belting is as efficient as any belting you can buy. It costs less than leather, rubber or balata. Figured on a basis of "service per dollar," it is the best belting buy on the market. It is strong, durable, economical, efficient and true running. Satisfied users throughout Canada will verify these statements. We will gladly send samples and prices on request.

MAPLE LEAF DRESSING—*Best for All Belts*

Maple Leaf Belt Dressing does not contain resin, mineral or animal oils or other ingredients harmful to belts. All belts should have an occasional application of a reliable dressing in order that the best results be obtained. We recommend Maple Leaf Belt Dressing as the safe and sane treatment.

Go over these features that make "ALLIGATOR" the best belt lacing proposition for you and for your trade.

FLEXCO-LOK

Reg. U. S. Pat. Office

Steel Lamp Guards

Protects lamps from breakage and theft—property from fire. An efficient, inexpensive security against danger, losses and delays.

Made in all styles and sizes with reflectors and handles if desired. Patent lock prevents theft. Sold at a distinct economy to the purchaser. Write on letterhead for information, prices, etc. Not in stock in London.

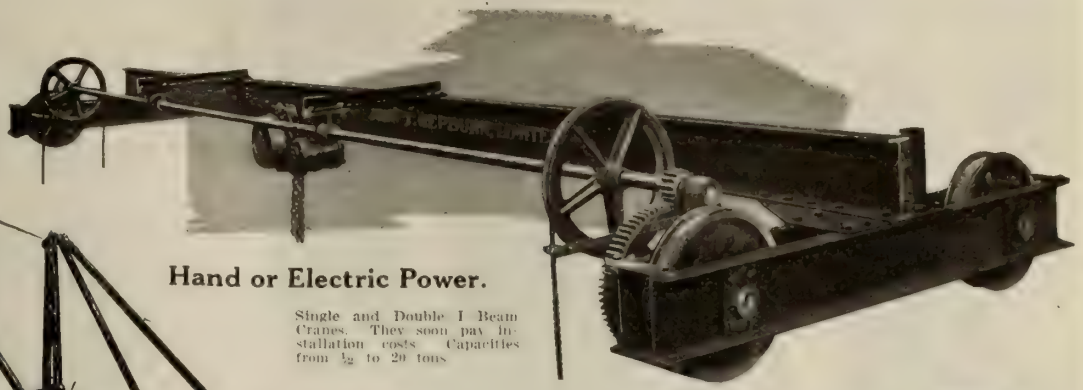
First: National and local advertising in carefully selected general publications, trade papers and consumer class publications interests all belt users and creates a demand that has been growing for twelve years.

Second: ALLIGATOR is preferred by Master Mechanics in every industry all over the world for its ease and facility of application, long life in operation, belt saving characteristics and economical features. The decision of hundreds of thousands of belting users should influence you to stock it.

Here are other reasons:

ALLIGATOR is the most easily and quickly applied of all belt lacings. **Only a hammer needed and three minutes average time** to lace a belt. Anyone can put it on.

Besides this important feature, this belt lacing has proven the strongest and consequently the **most efficient** in every test.



It outlasts any other type of belt lacing—and **saves the belting.** See illustration and note how the staggered teeth penetrate without injuring the belt and clinch down flat. Also note the sectional steel rocker hinge pin which makes a flexible hinge joint that hugs the pulley, is no thicker than the belt, and permits belt to be run on both surfaces.

In addition the use of ALLIGATOR Steel Belt Lacing is the most economical manner of taking up stretch on new belts and of relacing and repairing old ones. Only one end of belt need be cut off in shortening; or to lengthen, insert stub of correct length.

Can be kept handy in stockroom or tool box for immediate service thus avoiding any possible delays. Represents big saving and convenience to your customers on any kind of belting. A complete service for all thicknesses of power or conveyor belting. A size and type for every need. Write on letter head for samples and trade prices.

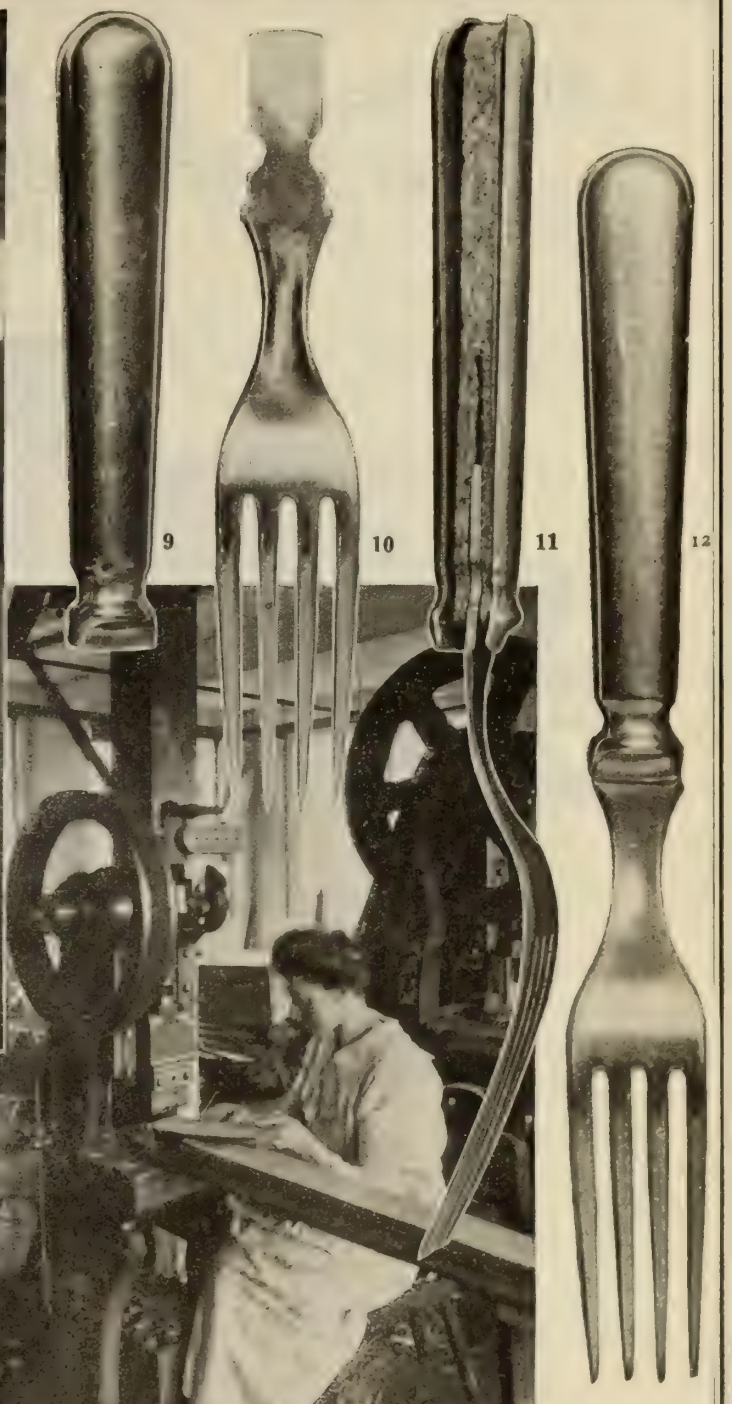
NO TAPPETS
NO LEVERS

Hepburn Patent Vacuum Pump: An improved self-draining type that makes possible great steam economy. Other valuable features are incorporated. Write for catalogue.

Kitchen and Table Cutlery

Produced Entirely on "BLISS" Presses

These photographs, taken in the plant of H. C. Hart Manufacturing Company, Unionville, Connecticut, illustrate the method of producing low-priced Kitchen Cutlery in large quantities.



"BLISS" Presses are used for all operations excepting grinding and polishing. The first operation is cutting blanks. Fig. 1 shows blank for handle; Fig. 4, blank for knife blade, and Fig. 5, blank for fork.

The second step is panelling the handles, Fig. 3; the cork filler for the handles is blanked, Fig 2, and the two successive operations in cutting the fork tines, Figs. 6 and 7.

The final steps are bending, assembling, and closing the handles, illustrated in Figs. 9, 10, 11 and 12.

The photographs of "BLISS" Presses in operation show, on the opposite page, panelling of handles; at the top of this page, assembling and closing, and, at the bottom, blanking of cork fillers.

A very high production rate is maintained on these operations—approximately 20,000 per 9-hour day on blanking, 12,000 on panelling, and 5,000 for the assembling and closing. All figures are per machine day.

"BLISS" Presses are adapted to all kinds of Metal Stamping, increasing production and making it more economical.

Butterfield

Taps, Dies, Drills, Reamers and Cutters

For Better Service

YOUR mechanics appreciate tools of QUALITY in their milling, drilling and reaming operations, and when provided with such tools they turn out a bigger and better day's work. Furnish your mechanics with Butterfield tools. Compared with any ordinary drills, reamers or milling cutters, the Butterfield line cuts faster, more accurately and require less regrinding. They cost no more than ordinary tools. Try them—they are "the tools you buy again."

These PHOTOSTAT Prints Save as much as $800 a Week

A well-known mid-western tool company writes:

"As a matter of fact, thirty draftsmen would be required to handle the work that ten draftsmen and one PHOTOSTAT now accomplish, which is a direct saving in salaries alone of approximately $800 per week."

Tracing isn't necessary, because you can copy with the PHOTOSTAT in a few minutes either a drawing, a pencil sketch or a blueprint which it would take hours, and in some cases even days to trace.

Even the best draftsmen sometimes make mistakes or omissions.

The PHOTOSTAT Makes No Mistakes
(Reg. U. S. Pat. Off.)
It makes photographic facsimiles.

Any steady office boy or girl can learn to run a PHOTOSTAT in a few hours.

The Photostat is not limited to copying drawings and blueprints. It is widely used for office copying work, such as letters, telegrams, reports, shipping lists, contracts, ledger pages, insurance records, graphs, and legal documents.

In all this work the PHOTOSTAT takes minutes where other methods require hours, and with the PHOTOSTAT there is absolutely no possibility of error.

The PHOTOSTAT will copy at original, reduced or enlarged size and with the same or reversed black and white values. In the advertising department it is a great time saver and also very convenient. It shows how drawings will look when reduced to size, and whether light or dark backgrounds will be more effective. It makes all the necessary duplicates for layouts.

Just ask for our Booklet the "PHOTOSTAT and What It Will Do."

"You Can Make a Barn Door Fly—

if you give it enough power"

THE man who said that was thinking merely of bare, basic principles—not of control and safety and the other indispensable factors that make flying practicable and useful.

When case-hardening is among the indispensables, Cast Nichrome Containers are more than a source of economy; they are a decided aid to quality results. The evidence exists in hundreds of plants—and in millions of machines on which the commercial world depends.

The uniform way in which Cast Nichrome Containers behave under repeated heating and cooling contributes to uniform results in the carbonized parts. Shorter heats, less fuel consumption, greater furnace capacity and less spoilage of materials are added advantages. The Nichrome economy guarantee, which is based on furnace hours at 1800 deg. F., applies to all stock patterns as well as to special designs.

INDUSTRIAL WORK GLOVES *and Mittens*

No. 681 Short Mitten. Reinforced with Steel Ribbons over Strips of Tough Leather. Closed with Steel Thread.

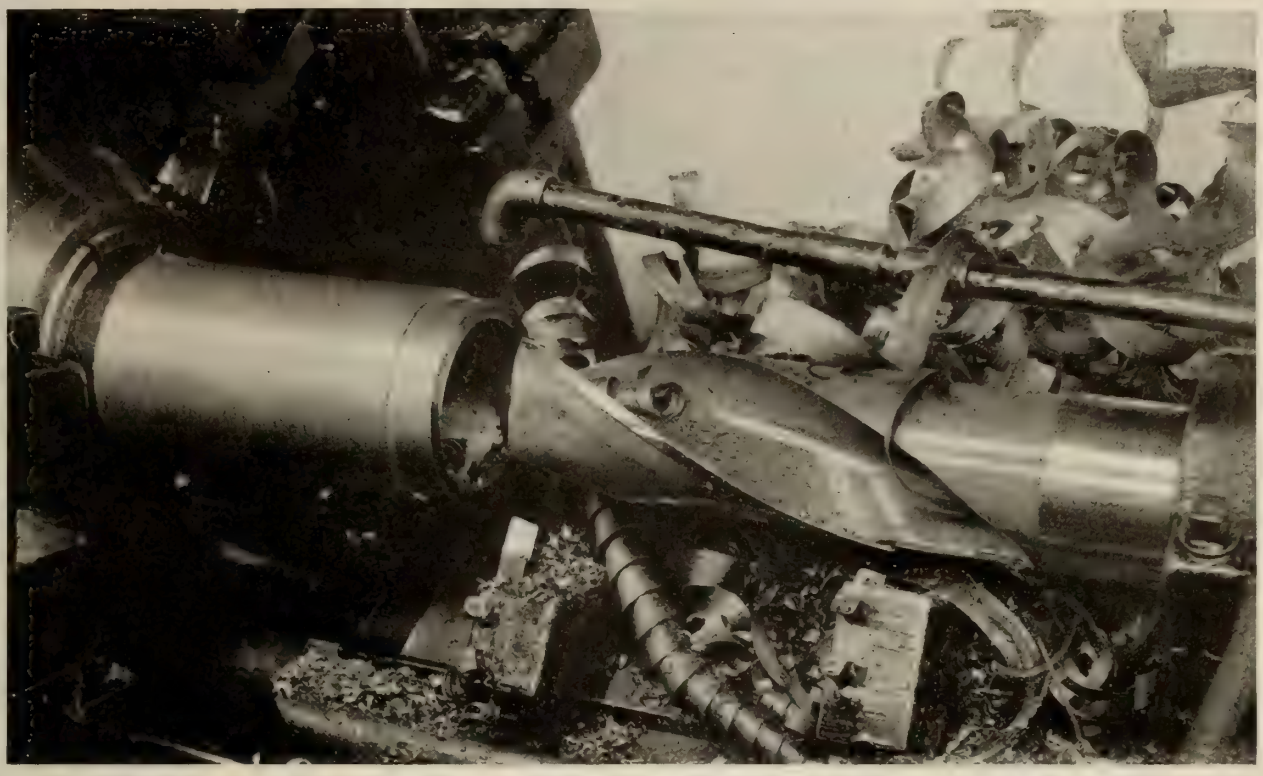
WHEN the sparks fly and the splinters cut—wherever the job is rough and hard on the hands—it is good business to have your workmen protected by these practically impenetrable Steel Grip work gloves. And how they will dig in and work!

Steel Grip work gloves wear and wear! Patented reinforcements of steel ribbons on palm, fingers and thumb and steel-sewed seams make them the most economical gloves and mittens made. They wear like iron because they are practically made of iron.

Flexible--- and Easy to Work with.

The steel ribbon reinforcement, which lengthens the life of the glove, in no way interferes with flexibility. The gloves are soft, pliable and comfortable. The steel sewing makes them absolutely rip-proof.

Let us show you how to overcome hand protection problems and save you money on your glove purchases. Write for interesting suggestions to-day.



No. 605 Short Glove. Reinforced with Extra Leather Patch on Palm and Steel Ribbons. Steel sewed.

INDUSTRIAL GLOVES CORPORATION

Your Heavy Jobs Automatically— on a GRIDLEY

Many heavy jobs in turning, drilling and forming work formerly done the long way are being switched to the Gridley Automatic basis.

They take the fast feeds and their accuracies stand up under continuous running. They save time between cuts, reduce labor costs, conserve space.

New friends adopt Gridleys, and old users buy more of them because they **know** that they produce more, save more and earn more per dollar of investment.

Gridleys give production that will meet the competition of lowering costs—why not find out how many on your work?

A New
Drill for a
Neglected
Field
MEZZO

A New Drill for a Neglected Field

FOR YEARS there has been a neglected field to which drill manufacturers have not given sufficient attention. This field is the shop which could not obtain production with Carbon Drills and yet was not equipped to realize full efficiency from High Speed Drills, and therefore could not use them satisfactorily.

These shops demanded a drill which would stand higher speeds and feeds, give far greater drilling capacity than Carbon Drills and still sell at a moderate price.

To meet this demand, we present

MEZZO

Heating the cutting edge of "MEZZO" even to a dark blue color will not draw its temper. "MEZZO" works at its best efficiency this way.

"MEZZO" was developed after months and months of research involving not only the use of a new steel but also new hardening and heat treating processes.

We believe that we have extended our leadership into a new field—but not with an untried product.

"MEZZO" has been tested and re-tested—a drill on which we are proud to place our name.

Write for the *"Story of Mezzo."* It is a most interesting little booklet which gives full information on "MEZZO" and its uses.

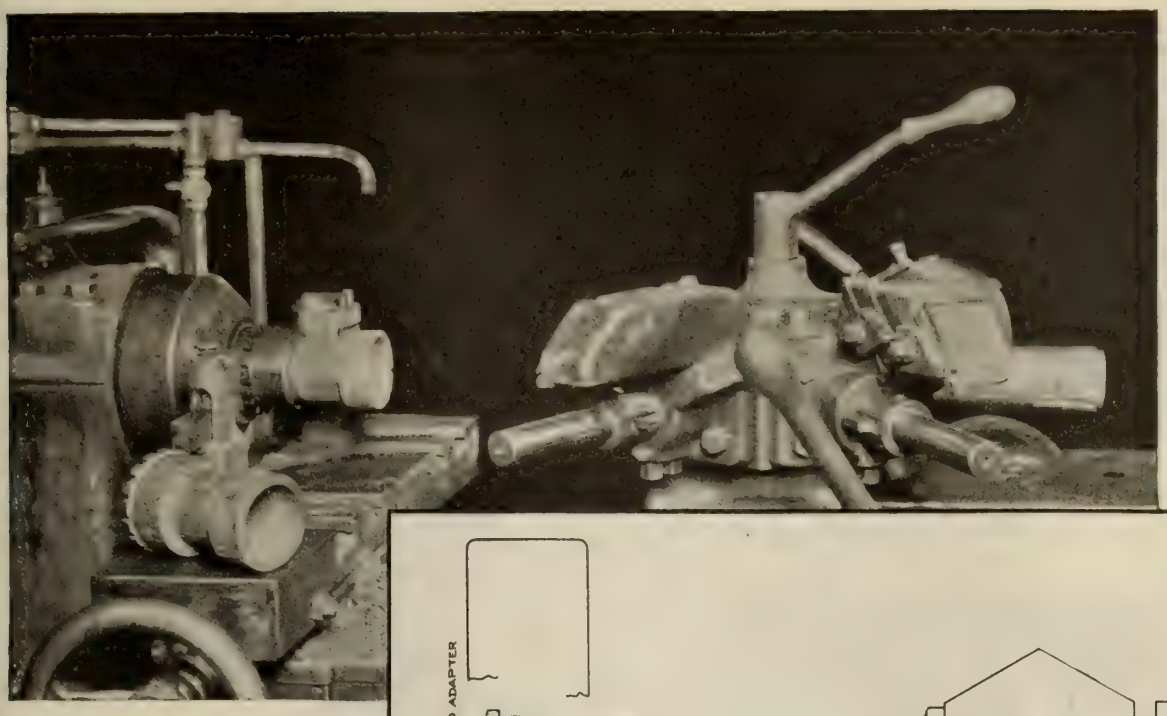
Accuracy and Efficiency

SOMETHING NEW
YET TESTED AND TRIED

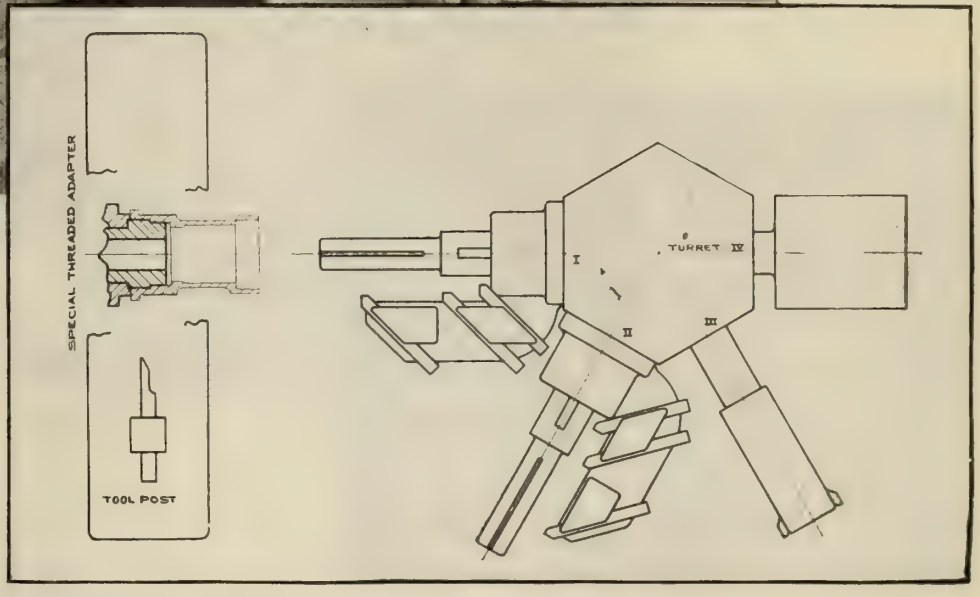
THE LUCAS VERTICAL BROACHING MACHINE

(A modification of the Lucas Power Forcing Press)

Has been in successful operation for over two years on **vertical push-broaching and production assembling.**



ADVANTAGES



Shorter, and therefore less expensive broaches.
Better lubrication of cutting edges.
Easier setting of work, easier manipulation of broaches.
More production.
A choice of fixed positions for the operator.
LEVER CONTROL (adjustable for height).
LESS FLOOR SPACE REQUIRED.

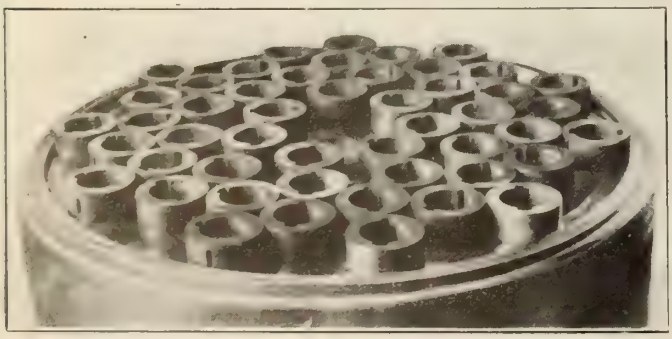
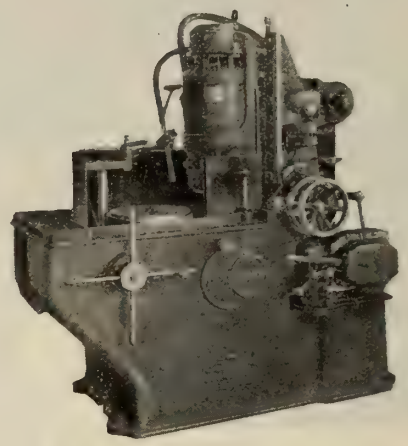
BLANCHARD

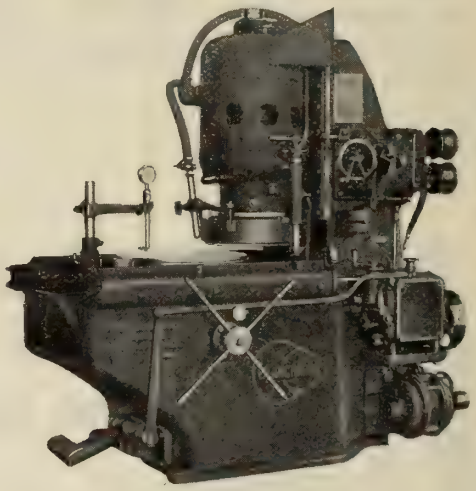
HIGH POWER VERTICAL SURFACE



GRINDERS



Lathe Quadrants ground on the No. 16 Blanchard Grinder at the rate of 12 pieces (24 surfaces) per hour. This piece is an iron casting 1/16 in. is removed from each side to a tolerance of ± .001 in.—the floor to floor time is **five minutes per piece.**



This pile of work is in a large steam pump shop, where one Blanchard was bought for only two jobs. So many other jobs for the machine were found that within two years four Blanchards were kept busy.

Bushings with key-ways for dive keys, first ground from the forging, while soft, and after hardening ground again at the rate of 175 pieces (350 surfaces) per hour, removing .010 in. per side hardened steel, to a tolerance of ± .002 in.

No. 10 Blanchard Grinder.—Direct motor drive type, 10 h.p. motor on spindle. Range: 18-in. diameter x 6-in. high under new wheel. Wheel: 10-in. diameter. Chuck: 16-in. diameter. Weight of machine, 6,000 pounds.

No. 16 Blanchard Grinder.—Direct motor drive type, 25 h.p. motor on spindle. Range: 30-in. diameter x 14-in. high under new wheel. Wheel: 18-in. diameter. Chuck: 26-in. or 30-in. diameter. Weight of machine, 9,500 lbs.

A larger size Blanchard Grinder, the No. 27, is being built and inquiries regarding work beyond the capacity of No. 16 are invited.

MILWAUKEE MILLING MACHINES

Milwaukee Milling Machines are cost reducing machines and are adapted for mass or diversified production. They are scientifically designed and constructed, embodying many features that prove their value in accuracy, increased production, quality of output, low up-keep and ease of operation.

The Column is a one-piece, box-section, semi-steel casting with few and small openings and is tied together by strong, internal walls.

The Double Overarm construction consists of two parallel steel bars and with the triangular arbor supports provides positive alignment of the arbors.

The Flanged Spindle provides means for effective driving of cutters and arbors in either direction. The spindle is reversed by mechanism within the machine, no overhead apparatus being necessary.

The Solid Top Knee is a box-section, semi-steel casting without holes or slots in the top to close under pressure of the clamps or work.

The Automatic Flooded Lubrication System floods lubricant over all gears and through all bearings in the column, feed box and pulley bracket of the machines, minimizing supervision and eliminating danger of bearings being cut, shafts sticking or gears wearing away.

Milwaukee Milling Machines insure complete milling satisfaction.

No. 5 Cylinder Grinding Machine

With a cylinder centering fixture that is positive.

Adjust thimbles to end holes and transfer to machine.

It must come central because its position is "fixed" in relation to centre of wheel spindle rotation. No setting to scales or stops—thus the chance for error is eliminated.

Time consumed in setting up jobs is lost motion. The machine that reduces this lost motion is the profitable tool. This is only one of the many features of the LANDIS.

Write for literature.

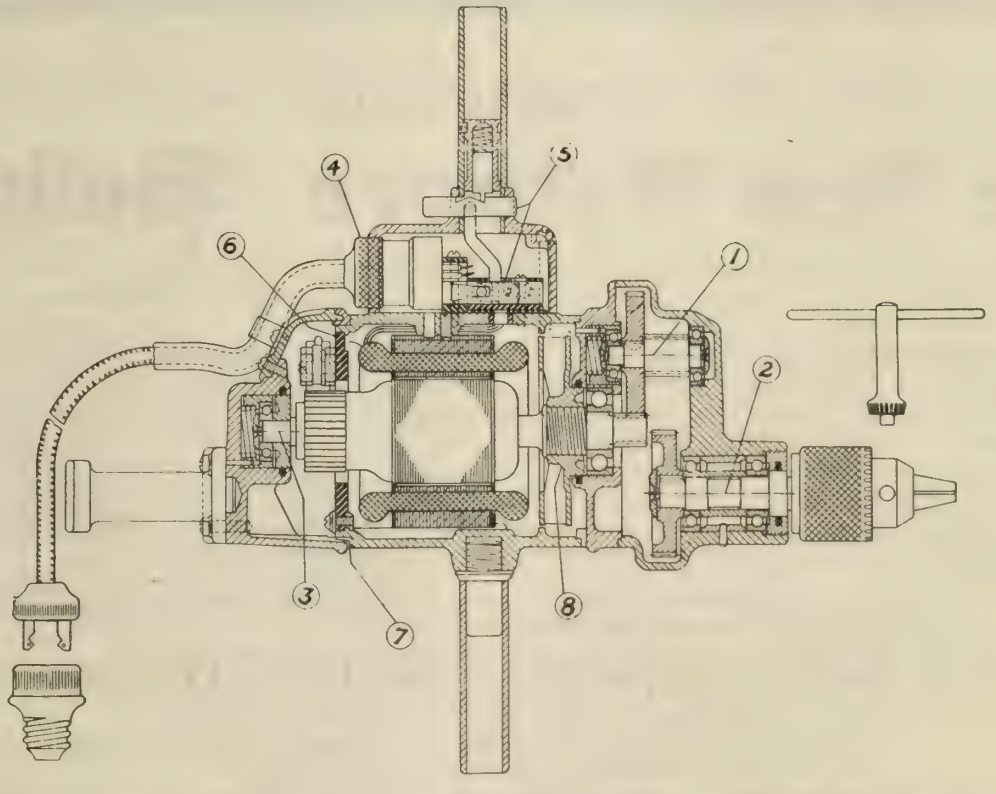
New Hisey

Patents Pending



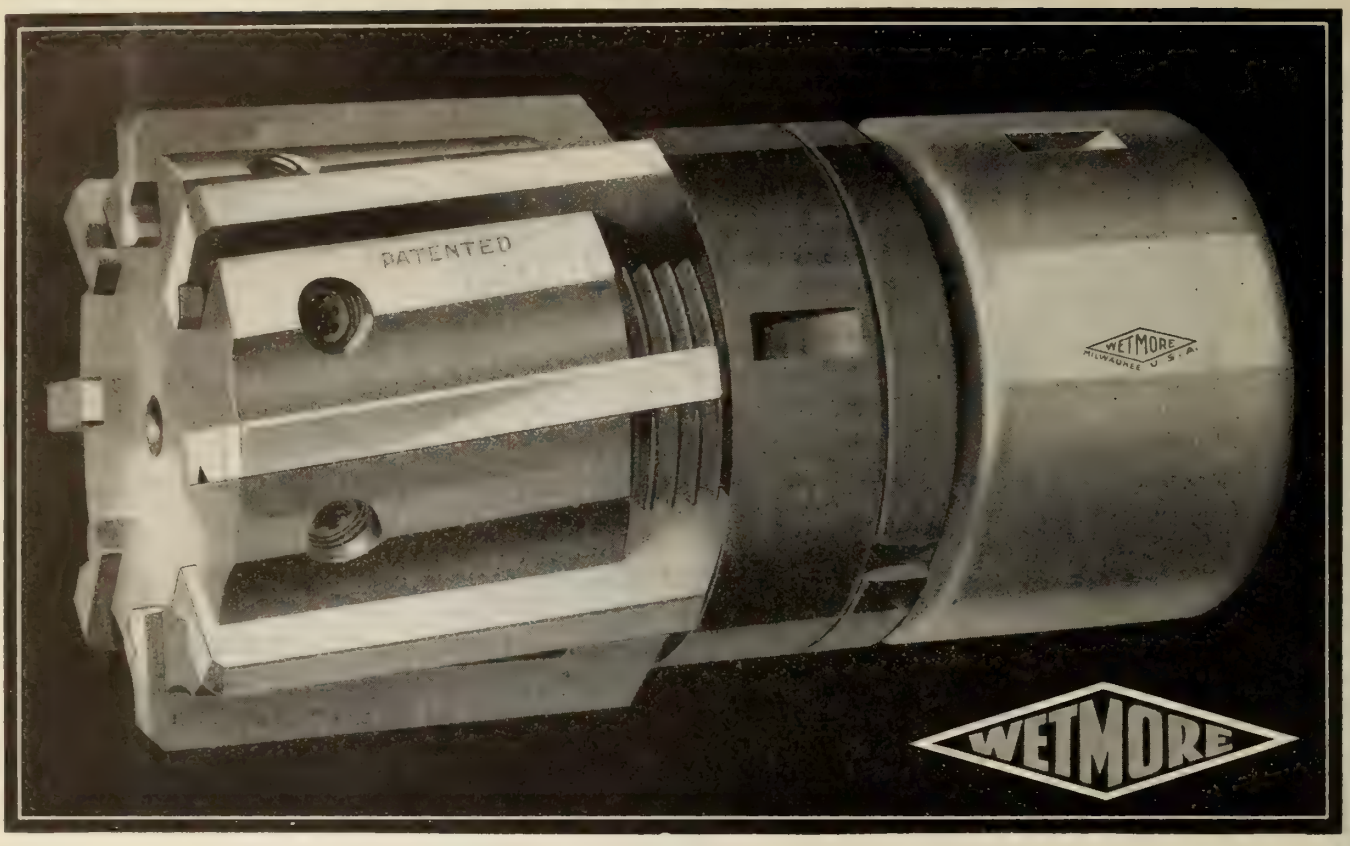
SUPER *Universal Drills*

POWER is very essential, and there is an abundance of this in the new Hisey Super Universal Drill, and some to spare. It is not an assembled machine with an ordinary stock power motor, but a product scientifically designed and manufactured by an organization with nineteen (19) years' experience.

Equipped with Super motor of our own design and manufacture and guaranteed to do more work at a lower operating cost (Current consumption) than any drill of same rated capacity.

Mechanical construction of Hisey machine is of the highest grade as can be seen from sectional drawing.

1. **Ball Bearing Gear Spindle**
2. **Ball Bearing Chuck Spindle**
3. **Ball Bearing Motor Shaft**
4. **Quick Cable Connector**
5. **Famous Hisey Patented Switch**
6. **Adjustable Brush Holder Yoke**
7. **Improved Vent Openings, Safeguard the Motor and Interior Parts Against Accidental and Wilful Abuse.**
8. **Improved Ventilating Fan**



A high-grade product built to meet the most trying and exacting conditions. The installation of a new Hisey Super Drill is a real investment, and a guarantee to your satisfaction; is the best proof that the first cost represents but a meager portion of real economy.
⅜-in. and ½-in. sizes can now be shipped from stock.

Hisey Super Universal Drills are particularly adapted for 25 cycle, alternating current service

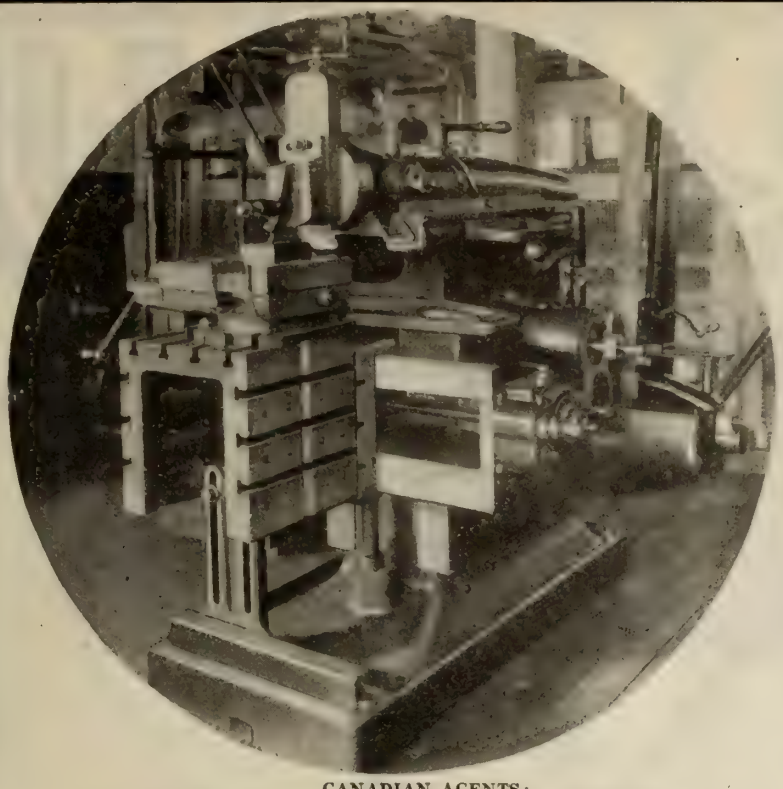
Announcing

The New Wetmore "Bulldog"

Combining all the advantages of both solid and adjustable reamers, this new Wetmore Expanding Heavy-Duty Reamer (6, 8 or 10 blades) represents the highest development of quantity-production precision tools.

No huskier or more enduring reamer has ever been produced for heavy duty work than this Wetmore "Bull-dog." The body is **guaranteed** against breakage, even under severest reaming tests. Its new tongue drive relieves the strain on the coupling nut. Assures perfect alignment between arbor and body. Large adjustment provides for wear and regrinding, so that the "Bull-dog" with its original blades will outlast several solid, non-adjustable reamers.

In every detail—design, quality of materials, workmanship, finish—the "Bull-dog" is typical of Wetmore standards of manufacturing. And the more carefully you compare it with other good reamers, the more you will appreciate these advantages of Wetmore Expanding Reamers:



Left Hand Angle Cutting Blades that prevent digging in, chattering, and scoring of the reamer while backing out.
Solid, heat-treated alloy steel body—guaranteed against breakage.
Adjustments to the thousandth of an inch can be made in less than a minute. In fact, the Wetmore is the quickest and easiest adjusting reamer made. Cone expansion nut keeps blades always parallel with axis.
No grinding arbor required for regrinding. Wetmore Reamers can be reground on their original centers.

The above are just a few of many features of Wetmore Expanding Reamers. Let us send you our 1922 Catalog—just off the press. No better "hand-book" on reamers was ever published, we believe. Write for your copy.

KEMPSMITH

A Tool is Judged by its Makers!

We don't buy machine tools these days without finding out something about the firm that makes them; for a machine tool cannot be efficient unless the parent plant is efficient. Hence it follows logically that the greater plant efficiency means greater tool efficiency. Canadian buyers in investigating our tools will do well to consider the **KEMPSMITH plant.**

The Ideal Plant for Specialized Tool Construction

It is located in a new and rapidly developing section of West Allis, where the ten acres we own give abundant room for expansion. There are four buildings, aggregating 90,000 sq. ft. of floor area; Machine Shop, 250x300 ft., the model shop of its kind; Pattern Shop absolutely fireproof; Power Plant a neat and complete direct connected power unit; three story Office Building. Every detail of system and equipment in the shop is carefully planned for its function in the advantageous construction of this specialized line.

All machines and parts are built in multiple lots, under a complete system of jigs, and templates, and all parts are completely interchangeable at any time. A spacious tool room is centrally located in the shop. There are also separate enclosures for rough stock, finished stock and stores, and for finishing and shipping, so planned that the parts in ordinary course of manufacture shall make an automatic circuit of the shop to the assembling and shipping floors. Recognized experts have planned our lighting systems (natural and artificial) sanitary systems, etc. Consequently the work is done under the best conditions.

THE KEMPSMITH

MILWAUKEE

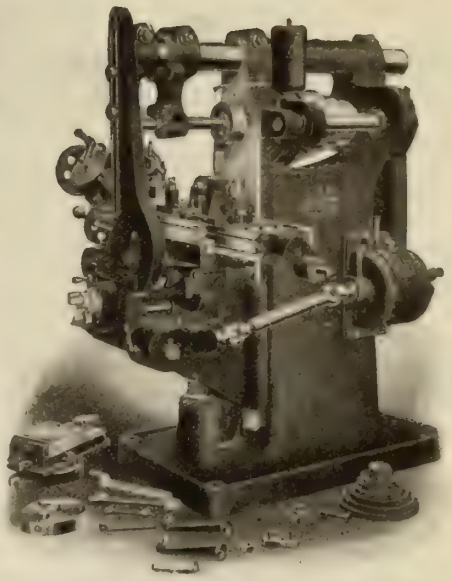
Milling Machines



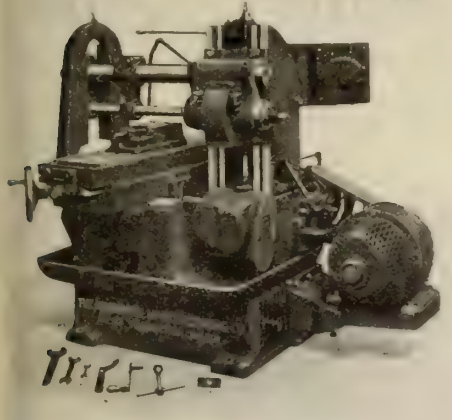
and Attachments

How Durability is Tested

Every machine, whatever size or type, is put to test under cuts and conditions purposely more severe than it will encounter in even the most progressive shops.

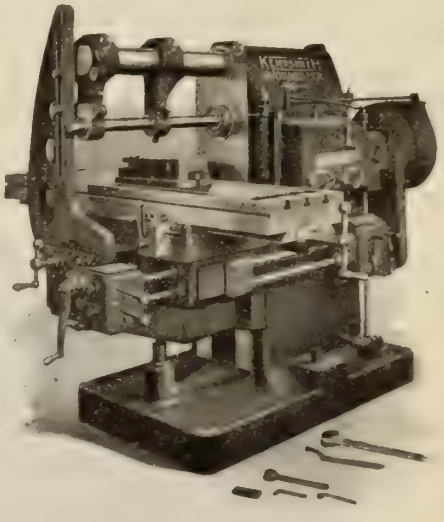
Why They Are Guaranteed

So confident are we after this test that every machine carries our definite guarantee. Note the massive proportions of the column, knee, table, etc.; the wide range of feeds; liberal bearings; the excellence of our entire feeding mechanism; the centralized location of operation at front of knee.



Cone Type Miller: A true reflection of our ideal —highest quality only.

The Three Essential Points



Summing up the foregoing you will see that KEMPSMITH MILLERS represent:

1. A machine design of established excellence.
2. A highly modern factory and equipment with specialized systems.
3. Trained and specialized mechanics under the most favorable conditions and under a system of rigid inspection.

Our line embraces plain and universal milling machines and attachments of all kinds. Write for our latest catalogue.

No. 33 Production Type Miller: For rapid and accurate production.

Maxmiller: A design which is undoubtedly the acme of present milling development.

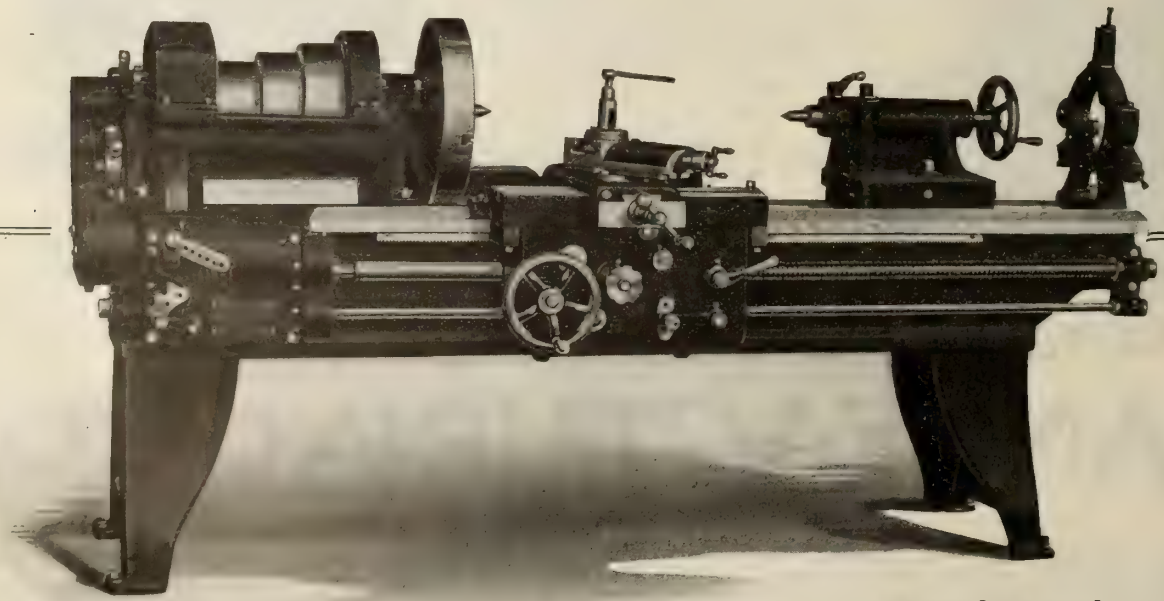
SIDNEY
for SERVICE

HIGH DUTY ENGINE LATHE



THIS is a machine tool of extraordinary build. The entire quick change gear mechanism is mounted on the front of the bed. It is fixed permanently in accurate alignment by a tongue and groove, and is a complete unit, in which every gear is made from high carbon steel. The cone gears, because cut with improved 22½ degree angle cutters have pointed teeth slightly rounded at the top—the only gear in tumbler gear mechanism that can and does make instantaneous engagement without interference.

Bed of 25 per cent. steel mixture has heavy double wall cross girts, two feet apart. Its rigidity is great, because ordinary construction would not stand up under strain of such speed and deep cuts as this Sidney Lathe is capable of making.

Fast, efficient, economical tools are necessary to meet the intensive competition of today—Write for more information regarding Sidney tools.

$50 Worth of Books for $3

Fifteen of the Best Sellers of the Year For $3 if you subscribe to MacLean's Magazine

During 1921 MACLEAN'S, Canada's National Magazine, has published the whole or major portion of the following fifteen books, which have since been published in book form—or are shortly to be published:

(1) Reminiscences of a Raconteur
—Col. George H. Ham
The recollections of Canada's premier story teller, the C.P.R.'s knight of wit and wisdom, who has known every person worth knowing in Canada during the past half century.

(2) Masques of Ottawa—"Domino"
A series of brilliant, biographical sketches of Canadians prominent in politics and business; analogous to "The Mirrors of Downing Street."

(3) Canada at the Cross-Roads
—Agnes C. Laut
A series of vigorous, inspirational articles showing how Canada is standing on the threshold of nationhood; constructive criticism indicating how full national status is being achieved.

(4) Policing the Plains
—Rev. R. G. MacBeth
The latest and most authoritative history of the Royal North West Mounted Police, by a padre who himself took part in the Riel Rebellion and has associated with many of the leading characters in Canada's famous frontier force.

(5) The Drama of Our Great Forests
—Arthur Heming
The pulsating, throbbing, human-interest story of Canada's great northern fastnesses, told by the man who will go five hundred miles to get a fact; authentic, enthralling.

(6) The City of Peril—Arthur Stringer
An up-to-date narrative of a Bolshevistic plot which was nipped in the bud by an adventurous young millionaire; including a delightful Stringer-like romance.

(7) Pawned—Frank Packard
A fast-moving story of a triple regeneration, shifting with kaleidoscopic speed from the South Sea Islands to this continent—novel, intense, gripping, mystifying.

(8) The Valley of Gold—David Howarth
The first novel from the pen of an athletic Methodist parson now resident in Miami, Manitoba—a true-to-life account of the Qu'Appelle Valley of Saskatchewan as it was twenty years ago; vigorously, thoroughly Canadian.

(9) Mostly Sally
—Pelham Grenville Wodehouse
A worthy successor to "The Little Warrior," told in the inimitably facetious and whimsical vein of this English master-craftsman.

(10) The Yellow Streak
—Valentine Williams
The story of a murder mystery solved by real human beings: from the pen of the author who wrote "The Man With the Club Foot."

(11) The Gates of Tien T'ze
—Leslie Howard Gordon
An enthralling book which ran in MACLEAN'S as a five-part serial; dealing with life in London when Anglo-Saxons and Chinese met at cross purposes.

(12) Lenix Ballister, Diplomat
—Archie McKishnie
A dozen short stories about the typical Canadian negro of Western Ontario; a forthcoming volume from the pen of one of Canada's foremost fiction writers.

(13) Prince Renine—Maurice Le Blanc
Eight more stories in which the leading character is the thinly disguised Arsene Lupin, one of the world's famous characters in detective fiction.

(14) A Series of Short Stories
—"Sapper"—H. C. McNeile
Ten or a dozen brilliantly written stories, impregnated with human interest, from the pen of one of the most successful English authors brought to the fore during the war.

(15) The Man Who Knew Too Much
—G. K. Chesterton
A collection of eight stories, each with its distinctive mystery, and containing the usual Chestertonian twist, from the pen of the man who wrote the "Father Brown" series.

Readers of MACLEAN'S got all these books in 1921—ten books of fiction and five of a more serious character, biographical, reminiscent, political—permanent literature.

In addition, they got a most attractive offering of the best short stories and the twice-a-month Review of Reviews department, which kept them posted on current topics and developments in all parts of the world, as well as the multitude of Special Articles on Topics of National Interest in Canada, which have made MACLEAN'S something more than a magazine—a National Institution.

MACLEAN'S readers got all this immense value in 1921—in 1922 they will get bigger value still. And you get all this for $3.00—the price of a year's subscription—24 twice-a-month issues of

"Elkco"
"Elkco" Special
"Elk Steel"
"St. Marys"
"Keystone"
"M.D. Elk"
"Rotex"
"Elk Dust"
"Keystone Dust"
"Rotex Dust"

Elk Service Means Lower Costs

There are two important things to consider in buying firebrick—price and quality. When you buy ELK BRAND FIREBRICK we take a keen, unprejudicial interest in seeing that you get the class of firebrick you need. If a moderate-priced brick fills the bill we never recommend a brick of higher quality at higher price.

We make bricks in all standard sizes and shapes.

Elk Brands Firebrick are reliable. Specify them in your next order.

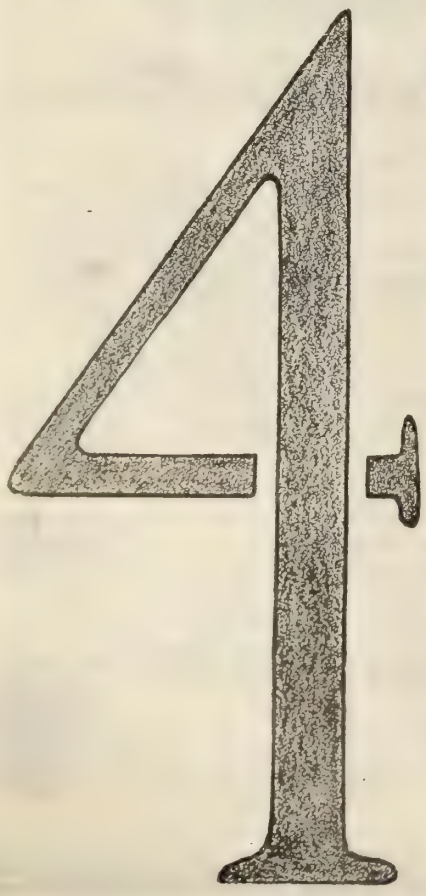
THE JOHNSON FRICTION CLUTCH

The Bertram Crank Shaper is started and stopped with a Johnson Clutch

John Bertram & Sons, Ltd., Dundas, Ontario, are building a shaper that is designed *right* from the practical standpoint of the user. Countershaft and tight and loose pulleys have been abolished in favor of friction clutch control—control that is immediate, and placed right under the operator's hand.



And Bertram has wisely selected the Johnson Clutch.

On a shaper, especially, convenient control is a valuable feature. But a good clutch is an essential on any machine —and there is none that will equal the Johnson.

Write for our Yellow Catalog.

Landis Threading Machines

They call this man a "Landis Walla" in Indian Railway Shops

IT'S A FAR cry from Waynesboro, Pa., to the shops of the Eastern Bengal Railway at Kanchrapara, British India; but it didn't take long for this Landis Threading Machine to pay its freight bill.

Used for threading bolts, locomotive set screws, and many other parts, it has not only set a new standard for quality, but left former production far behind.

Landis Threading Machines serve the mechanical industries throughout India. The Bengal Bridge & Bolt Company, for instance, whose plant is at Shalimar, Howrah, is equipped exclusively with Landis Die Heads and Machines in its bolt shop.

The introduction of Landis Machines into India created the new title of "Landis Walla" for its operators—"Walla," as every Anglo-Indian knows, meaning a worker. Native Labor in all countries quickly learns the few simple movements necessary to Landis operation, and the fact that the machine cuts both right and left hand threads from the same chasers adds largely to its utility.

Glad to send you a copy of the latest Landis Catalog.

VOL. XXVI No. 26 DECEMBER 29th, 1921

Business Can be Secured-If we go After It

THE YEAR 1922 will be a successful one for Canada, if we as Canadians do our very best to make it so. Occasionally you will run across some pessimist who will tell you **"hard times are coming."** Don't believe him. Give such a foolish and erroneous statement the death blow by replying that **"hard times are not coming, but soft times are going."**

Canada is too big a country to sit down and wait for **so called** better times. **"If we sit back and wait for business, business will likewise sit back and wait for us."** Times are what we make them. If you don't believe this statement, read over the various articles in the present issue. Every industry has a stirring story of achievement to tell. Great progress has been made. Developments almost undreamed of have taken place, and a spirit of optimism exists among manufacturers in general, that greater things are yet in store.

Two important factors in Canada's progress will be her Immigration policy, and her efforts to secure additional export business. The article by Mr. Stead, director of publicity, on Immigration and Colonization, contained in this issue, should have a far-reaching effect; Mr. Rankine's story of Canada's progress during the past decade should fill our hearts with pride; Mr. Hanna's tale of an uphill fight, with success in the end, should inspire us with enthusiasm, while on the other hand, the points brought out by Mr. O'Hara, Deputy Minister of Trade and Commerce, should be read and remembered by every manufacturer in Canada. Mr. O'Hara particularly emphasizes the need of **"thoroughness."** This advice could well be given to every one of our industries. If Canada's reputation is to be maintained we must, above all other things **"be thorough in our methods."**

A few pessimists may tell you that there is no chance to be **"thorough"** in the present state of depression, and that there is no use trying to get business today because there is none to be secured. **Don't believe such a foolish story.** Whatever deflation exists today is not so much the result of people refusing to buy, as it is **"that sellers have slackened up in their efforts to sell."** Competition is once more with us, and anyone who thinks otherwise need only look around him to prove this statement. Don't sit back and say there is no business to be secured, for there is—**"and the man who will land such business is the one who will go out and get it."** The day when buyers actually entreated you to accept their orders is gone. You now have to tell them **why** they should buy. Business **can** be secured by energetic salesmanship, coupled with judicious advertising. Selling the public is more important to-day than ever before.

If we as much as admit by our attitude that we do not expect our salesmen to secure business, then they most assuredly **"will not land any orders."** On the other hand, if we fire them with our own enthusiasm, at the same time adopting an aggressive selling policy, the result will more than surpass our fondest expectations. Let your salesmen understand they **must** secure business—**then watch them get it.**

We have passed through some rough industrial weather during the past year, yet while many firms were grumbling at the small sales, and threatening to give up the ship, others in similar lines were plowing into the waves, and are now sailing in the calmer waters of increased orders and prosperity, thanks to their individual and aggressive methods. **"Where there is a will there is a way"** is more than an idle saying. Get the will power, and even though the outlook may appear dark, you will be sure to find a way.

Canada is a **wonderful** country, and it has a **wonderful** future. Pin your faith to these facts, then **go-get** the business that is waiting for you, if you go after it hard enough.

The Year 1922 is going to be a **go-get-it** year, and the sooner you make up your mind to this fact the better. Get out and bring in the business instead of being content to sit still and await the coming of better times. **Times are what we make them.** Decide to eliminate all deadwood. Keep only the Go-Getters. Let every employee understand you demand and actually need business, then **go get some yourself,** just to show them how it's done.

Tracing the *Development* of the Year

In Spite of Depression Canadian Cities Have Prospered—Many U.S. Firms Locate in Canada — Extensions to Existing Plants Have Taken Place Generally.

HAMILTON ENJOYS PROSPERITY

Nineteen New Industries Have Located in Hamilton, Several Being Canadian Branches of American Concerns

By C. W. KIRKPATRICK, Commissioner of Industries and Publicity, Hamilton

HAMILTON.—While the abnormal conditions existing during the past year have militated against industrial expansion, Hamilton has enjoyed a fair measure of industrial prosperity, nineteen new industries, several of them Canadian branches of American concerns, having located here since the beginning of the present year. With but few exceptions, however, the new-comers are occupying buildings formerly occupied by other industries, there having been less industrial building during the past year than in any twelve months since the close of the war. This has been due largely to the unsettled conditions throughout, not only the continent of America, but practically the entire world. With the future somewhat beclouded, the manufacturer has shown, and is still showing, a tendency to move more cautiously than was the case during the prosperous war years and the two years immediately following and wherever possible he has secured a short term lease on an existing building rather than tie up considerable capital in building to suit his own requirement, when there is so much uncertainty regarding what the future holds in store.

Unsettled building conditions have also had a detrimental effect, there being a feeling common to all classes that building costs, both labor and material, are bound to take a drop. There has already been a considerable decline in building costs, but it has been so gradual that it has scarcely been noticed, although very substantial in the aggregate, and, at least so far as Hamilton is concerned, there are unmistakable signs that if the decrease is maintained until next spring, the next year is going to be an exceptionally busy one for the building trades.

While there are no indications of an early industrial boom, there is no reason to doubt Hamilton's continued industrial advancement. During the past year the local industrial department has been in touch, by correspondence or otherwise, with upwards of 300 British and American manufacturers who are interested in the Canadian and export markets and who have in mind the establishment of Canadian branches of their industries, some in the immediate future and others at more distant dates. The announcement of a general election caused a noticeable falling off in the number of industrial inquiries, more especially from the United States, indicating that Canada's future tariff policy is an important consideration with many prospective locators. There is, however, no reason to think that the lull is more than temporary.

Among the new industries to commence operations during 1921 were:—

Chadwick-Carroll Brass Co., Ltd., brass goods; Canadian Coffield Motor Washer Co., washing machines; Canadian Chick Hatcheries, incubator chickens; Canadian Oakville Fastener Co., dome fasteners; E. B. Ratcliffe, Ltd., cement products; Fuller Brush Co., twisted-in-wire brushes; Superior Engraving Co., half-tone cuts; Soy Products Co., artificial milk; Universal Milking Machine Co., milking machines; Wallace Barnes Steel Spring Co., steel springs; Canadian Horseshoe Co., horseshoes; National Slag Products Co., tiles; Ace Chains, Ltd., automobile chains; Cooperage Co., of Canada, barrels and kegs; McIntosh Granite Co., tombstones; Coulter Wood Products Co., wooden specialties; Cyclone Fence Co., wire fences; Eley Bros., knitted goods, and the Rexhide Leather Products, leather products.

One promising sign for the immediate future is the fact that several large industries that decided on Hamilton as the location for their Canadian plants during 1919 and 1920 but discontinued building operations when the period of depression commenced, have recently actively resumed the carrying out of their original programs. Notable among these is the Firestone Tire & Rubber Company, which is erecting a $5,000,000 plant here. This Company, after a year of comparative inactivity, recently put upwards of 150 men at work on its buildings with a view to their completion in time for manufacturing operations to be started early in the new year, so as to be in a position to take care of the spring trade from their Canadian factory. The Libbey-Owens Sheet Glass Company has also just about completed its $2,000,000 plant, and will be in active manufacturing operation before the beginning of the new year.

EXPECT MANY NEW INDUSTRIES TO LOCATE

Modern Harbor When Completed Will Have Cost $25,000,000—Waste Land Has Been Made Into Manufacturing and Storage Districts

By E. L. COUSINS, Manager Industrial Commission, Toronto

TORONTO.—A very decided increase in business optimism is noticeable in the interviews given by American and Canadian Industrial leaders. The general feeling is that the depression is over, and busy times just a block ahead. Unless some, at present, unforseeen conditions prevent, it is generally believed that the early months of 1922 will see a return to prosperous times.

Mr. G. D. P. Harding, Governor of the Federal Reserve Banks of the U. S., when addressing a convention of Canadian and American manufacturers and business men said: "I want to give you this message, and that is, that there is now no danger of any general financial trouble in this country. The time has come for renewed courage and confidence. We can take comfort in the thought that we have passed through the worst and that the problems ahead of us are all solvable."

That conditions in Canada are also becoming stabilized, is attested by the volume of building that has taken place this year ($122,000,000). Of this amount $19,000,000 was expended in Toronto. In spite of the depression in trade more than a score of new industries located in our city. During the past two years high construction costs have been responsible for many firms enduring much inconvenience through leasing floor space, instead of erecting their own building. To our knowledge several American companies have postponed entry into the Canadian market with branch factories, on account of high building costs. With the return of material and wages to a stable level it is easy to see that a distinct revival of industrial building will take place the coming year.

During this year an active campaign has been carried on by Toronto's Department of Industries having for its object the presentation to British and American industrial chiefs the exceptional economic advantages enjoyed by manufacturers who locate plants here. That this campaign has produced results is vouched for by the letters on file in our office. Personal relationships have been established with the executives of many industries, who will, because of the nature of the products they manufacture, become sooner or later prospects for settlement in Toronto.

The Toronto Harbor Commissioners have undertaken to build a modern harbor which when completed will have cost $25,000,000. In addition to the work of developing a deep water harbor, the Harbor Commissioners have created out of what was practically waste land, two districts, one especially suited to the requirements of heavy industrial processes and known as the Eastern Harbor Terminal District, and the other set aside for light manufacturing and storage warehouse purposes, known as the Central Harbor Terminal District.

In one of these two districts manufacturers of any product can be accommodated. Each industry is served by a private railway siding, exclusive dock facilities may be secured if desired or shipments made and goods received at a public dock conveniently situated to minimize freight handling. Freight and passenger stations of a publicly-owned long distance rapid interurban electric line will be located in or near the district, affording frequent opportunities for the distribution of goods to Ontario towns and cities.

Supplementing steam and electric railways and water transportation facilities, excellent concrete roads are laid throughout the district connecting with the well-paved main roads of the city affording easy and rapid trucking between the various industries and any point in the city or vicinity within trucking range. With the above modern facilities which Toronto now has to offer, and with the new stimulus business is now receiving, 1922 should without doubt see more branch plants of American and British industries located in this city, and expansion of many of our present factories than any previous year.

CALGARY HAD A BIG YEAR

Building Permits For the Months of 1921 Reached Over Two Million Dollars—Irrigation Receives Attention

By JOHN H. HANNA, Secretary Calgary Board of Trade

CALGARY, Alta.—Calgary's building operations for the year 1921 compare very favorably with a year ago, and in fact are somewhat gratifying in the face of the general decline in business all over the world. While the total figures are not as large as in 1920, it must be kept in mind that the prices of material and to some extent the rate of wages, were lower in 1921, so that the volume of building in Calgary during the present year was equal to that of the previous year, although the total value was not so large.

The building permits January 1st to October 31st, 1921, amounted to $2,020,800 as against $2,532,200 for the same period in 1920. The chief items making up this total are: 133 houses, improvements to Royal Bank, new warehouse for Vernon Fruit Co., several new coal sheds, new warehouse for Lake of the Woods Milling Co., new show-rooms and garage for Maclin Motors Ltd., a number of retail stores and several schools and churches.

The Alberta Flour Mills, Ltd., added considerable to their building which has been under construction for some time and upon which a large amount of work is still to be done before it is completed.

The largest single items were the rebuilding of the Royal Crown Soap Works, partially destroyed by fire recently, and the Institute of Technology and Normal School, upon which considerable progress has been made, but which will take several months more to complete.

Efforts are being made to increase the activity in the building trade and a convention will be held in Calgary during the first week in March, at which representatives from all over Western Canada will be present. Calgary contractors and the various supply houses located in the city are joining heartily to make this gathering a great success.

The exceptionally dry summer, particularly in the southern part of the Province, resulted in a comparatively light crop and this, with the low prices now prevailing on all kinds of grain, has of course, curtailed the purchasing power of the farming community. On the other hand it has compelled attention to the importance of irrigation in certain districts and considerable progress has been made in this matter. The Lethbridge Northern Irrigation scheme is now well under way with every prospect that it will be completed and in operation by 1923. The new Alberta government are not only giving attention to irrigation, but recently appointed a survey board of well-qualified men to study the whole question of the conditions in Southern Alberta, including soil, soil drifting, irrigation, etc., and, if possible, find a solution for the difficulties.

So far as general industrial conditions are concerned, the factories in Calgary have been pretty well employed throughout the year, although during the past couple of months trade has not been as good as in the earlier part of the year.

SHERBROOKE HAS GREAT ACTIVITY

Improvement in Business Which Set in Last Summer Still Continues—Unemployment is Decreasing—Development Very Satisfactory

By J. H. BROSSEAU, Secretary-Treasurer Sherbrooke Board of Trade

SHERBROOKE.—It is not necessary to look far afield for evidence of increasing activity of business. Though opinions regarding the business outlook vary considerably, there is no question that the improvement in business which set in last summer still continues. Industrial and commercial activity is growing and unemployment is decreasing. That is the local condition but improvement in general can never continue unless it is backed by national and international improvement.

The industrial development during the year 1921 in Sherbrooke has been satisfactory from many points of view. The completion of the new plant of the Canadian Connecticut Cotton Mills; manufacturers of tire cotton fabrics, represents an investment of over $5,000,000, and in normal times will give employment to over 2,000 employees. The new plant of the Julius Kayser Company was completed this year. Their production consists of silk gloves, hosiery and underwear and represents an investment of over $3,000,000, and gives em-

A section of the Eastern Harbor Terminal District being developed by the Toronto Harbor Commissioners comprising approximately 700 acres available for new industries.

ployment to about 1,000 employees. The Superheater Co., Ltd., manufacturers of superheaters for locomotives, marine and stationary boilers; number of employees 150, cost of plant $250,000. The extension of the Sherbrooke Machinery Company, manufacturers of pulp and paper machinery, was erected at a cost of $100,000, and will enable this concern to double its production; number of employees, 100.

J. H. Bryant, Ltd., manufacturers of aerated waters, is one of the most modern plants of its kind in the country, which was erected at a cost of $75,000. This concern is doing good business. They give employment to over 50 employees. The new plant of the Canadian Sturdy Chain Company, manufacturers of gold, silver and platinum jewelry, was erected at a cost of $50,000. This new organization will give employment to a personnel of 150. Goupil, Ltd., manufacturers of chocolate, candy and ice-cream, have erected a modern plant of brick construction at a cost of $50,000 and give employment to about 50 employees.

The Office Requirements, Ltd., manufacturers of blank books, loose-leaf system, rubber stamps, etc., purchased a three-storey building at a cost of $50,000 on the main business thoroughfare. This concern is doing good business, and gives employment to 50 employees. The new plant of the Pressure Proof Rings, Ltd., manufacturers of piston rings was also completed this year at a cost of $25,000. Number of employees, 25. Another new industry for Sherbrooke is the Canadian Vesta Battery Company, Ltd., manufacturers of automobile batteries and is an additional link in making Sherbrooke an automobile manufacturing centre. At present, we have large factories manufacturing automobile tires, tire cotton fabric, rubber accessories and piston rings.

In reference to the industrial situation in Sherbrooke at the present time, we can say with satisfaction that during the last depression, not one of our plants has been shut down, although some had to curtail production, but to-day we find all our industries busy and increasing their production. The increase in incoming orders is in evidence more and more as we are nearing the new year.

The Board of Trade at the present time is in negotiations with two firms, manufacturing accessories of the automobile industry. It is also in negotiations with two large concerns, manufacturers of asbestos products. If these four concerns can be located in Sherbrooke, it will have the effect of revolutionizing its industries and should cause a boom in all lines of business. In all principal industries, conditions appear to be steadily improving and prospects are brighter. I believe a reduction of freight rates would lead to greater confidence in business revival. Therefore, we are confident that within a short period, the local industrial situation will be again on a normal basis.

ST. JOHN HAS MANY EXTENSIONS

Although Few New Industries Have Located in St. John The Established Ones Have Built Extensions

By R. E. ARMSTRONG, Secretary-Treasurer St. John Board of Trade

ST. JOHN.—The past year has been a comparatively quiet one in this vicinity, so far as new industries are concerned. Some of the older industrial firms have been extending or improving their plants. The Cornwall & York Cotton Mills Co., have just completed an extensive power house, alongside their York mill. T. McAvity & Sons, are making preparations for the carrying on of an extended business in brass work, valve, pipe and machine construction at their new plant.

Mr. Allan McAvity has also established an oil bunkering tank with a 55,000 barrel capacity to supply shipping with fuel oil. The wharf facilities are not yet completed, but it is intended that the plant shall begin operations when the winter shipping season opens within the next few weeks. The old foundry firm of James Fleming have added the handling and repair of automobiles to their machine plant and have been functioning along that line the past summer.

Clarke Bros., of Bear River, N.S., have established a paper and fibre manufacturing plant at Glen Falls, in the suburbs of the city. Up to the present their manufacturing has been confined to fibre cases. The Stephen Construction Co. have just recently acquired the old Lee brick yard, East St. John, and will resume the manufacture of bricks in a short time. This plant has not been operating for several years.

Spice manufacturing on an extended scale is being carried on by the Canada Spice and Specialty Mills, who have taken over the building formerly used by the Dearborn Spice Co. G. E. Barbour Co., who have been in the spice business for several years, have acquired the Ready Beverages buildings in the centre of the city, and have greatly extended their plant.

Two large ice cream plants have been added to the industries of the city within the past year. These are the Purity Ice Cream Co., and the Pacific Dairies, who have just completed a modern brick factory in the heart of the city. The former Smith foundry has within the past year been acquired by the firm of Harrigan and Howard, who are carrying on under the firm name of the Courtenay Iron and Brass Works.

The Campbell and Fowler edge tool manufacturing plants have within the past year become merged together and are now functioning as Campbell & Fowler, Ltd., manufacturing auto springs and edge tools. The Murray Co., of Canada, and the Wilson Chemical Co. are carrying on a joint and growing business in the manufacture of fruit extracts. Among recent additions to metal working plants of the city are the Peerless Motor and Machine Shop; Murphy Bros., edge tool makers; Dick & Dodge, machinists.

GALT HAS STEADY GROWTH

Several New Industries Find Accommodation—Season Has Been Active in the Building Trades

By HENRY J. FOSTER, Secretary of Galt Board of Trade

GALT, Ont.—During the year 1921 this city has witnessed considerable activity in the building trades, the largest building under construction being a three storey steel, brick and stone structure for the Public Utilities Commission. It will house the sub-station equipment, sales room and business office of the Hydro Department, and also the business office and warehouse of the waterworks department. The estimated cost of the building with its equipment is $200,000. Another large structure under construction is an arena which is of steel and brick and will cost $90,000. A new building for the Royal Bank of Canada and a four-roomed addition to St. Andrew's School, are two large jobs finished this year.

There have been few additions to industrial plants. Among those that have been put up is a two storey brick extension 112 x 96 feet to the plant of P. W. Gardiner & Son, sash and door manufacturers. W. A. Dixon has erected a new two storey brick bakery capable of producing 20,000 loaves a day.

New industries which have started this year, having found accommodation in existing buildings, include the Arrow Signal Lamp Company, Beaver Saw Works, Galt Chemical Products Limited, Galt Wood Products Company, Gill Brass Goods Mfg. Co., Hi-Speed Tools Company, A. E. Johnston, manufacturer of wicker furniture, and the Stevens Pattern Company.

The corporation has spent about half-a-million dollars on municipal improvements. New pavements alone will cost approximately $350,000. This will provide for about six miles of pavements. Some $150,000 has been expended on sewers, sidewalks, curbs and gutters.

OSHAWA HAS FORGED AHEAD

Although Feeling Pressure of Times Expansions Have Taken Place Along Various Industrial Lines

By J. A. McGIBBON, Secretary of Oshawa Board of Trade

OSHAWA.—The industrial situation in Oshawa has like other manufacturing centres felt the pressure of the present hard times, but in spite even of that it has managed to forge ahead to a considerable extent and to expand along various industrial lines.

The General Motors of Canada are to make Oshawa their export centre and for this purpose great changes will be necessary. The Felspar Glass Co. have located here and a new factory is now in course of erection. The McCulloch Auto Body Co. have moved into new and more spacious quarters; The Pedlar People are now located in their new plant and trade conditions in their line are looking better.

Several new buildings have been erected during the year including the new Bradley Block, Bank of Montreal, Union Bank and a large addition to the Dominion Bank, the old Queens Hotel has been turned into an up-to-date suite of stores, while Messrs. Jury and Lovall, druggists, have added two new buildings in the business section of the town. Other new buildings are The Engle Block, C. M. Anderson, T. H. Everson, R. S. Virtue, Oshawa House and Land Co., and the Bassett and McLeese Block. Several fine residences have been erected during the year.

WOODSTOCK SECURES PLANTS

Four New Industries Locate During Year—Textile Trades Have Been Active But Woodworking Quiet

By H. SYKES, Secretary-Treasurer Woodstock Board of Trade

WOODSTOCK, Ont.—This city is a woodworking and textile centre. It was fairly busy during the summer months in textile production and of late has been advertising for girls. These industries are operating to capacity and some, in fact, are working overtime. Prospects in this business are that the different factories will be busy till spring.

The woodworking industries were very quiet throughout the summer months. Several of them were shut down for short periods and now are operating on short time with reduced staffs. However, during recent weeks orders have been coming in a little more freely and the outlook seems to be that business will be fairly good up to the end of January.

A rather unusual feature of the labor situation here is the fact that during the summer months a large number of men who were laid off found other kinds of work to do, and few indeed were unable to get employment of some sort.

The metal trades are busy. Particularly is this so in the stove industry.

During the year four new industries established themselves in this city. They were the Kirsch Mfg. Company, of Sturgis, Mich., manufacturers of curtain rods and house furnishings; Canadian Ironing Machine Company, manufacturers of the Simplex Ironing Machine; Lewis E. Myers & Company, of Valparaiso, Ind., manufacturers of desks; and also a local organization, the Milko Company, Ltd., manufacturers of milk products.

Municipally the city has been very active this year in carrying out permanent improvements. The corporation's area of permanent streets has doubled in the past ten months at a cost of $162,539, with a total expense for permanent local improvements of $214,035. Generally speaking the merchants had a fairly good year, and are looking forward to a prosperous trade throughout the holiday season.

NOTHING WRONG WITH EDMONTON

Crops Have Been Good, Grain Has Been Sold, and Returns Are Reflected in Improved Collections

By J. BLUE, Secretary Edmonton Board of Trade

EDMONTON.—Speaking on the keynote in the business community of Edmonton, Frank Pike, in his address before the annual meeting of the Edmonton Board of Trade, hit the nail on the head when he said: "There is nothing wrong with Edmonton and the great district surrounding the city, though it cannot be denied that conditions in Edmonton are reflected by conditions on the outside. Crops have been good in the country, and notwithstanding comparatively low prices, the grain has been sold. The returns are reflected in improved collections and payment of outstanding obligations."

Industrial plants in Edmonton are working well up to capacity, and a number report that they are behind with their orders. During the year two new enterprises have been established in the city, namely, the Dominion Furniture Co., and the Dominion Carton & Printing Co. Both are making satisfactory progress and increasing their output every month. The North West Biscuit Co. has within the last few weeks moved into a new factory costing over $200,000. A few others have enlarged their premises and increased their equipment. There are no idle factories or stores in the city. If a new firm should decide to commence business in Edmonton, it would have to build its own premises. During the building season of 1921 over two hundred homes have been built, mostly by the owners at an average cost of over $4,000. This has done much to relieve the housing problem as well as unemployment. The best proof that Edmonton is not losing any sleep over the future, is that their population has increased 88 per cent. in ten years.

BRANTFORD NOT DISCOURAGED IN SPITE OF DIFFICULTIES

Agricultural Factories Have Been Hit Hard—Additions to Factories Have Not Been Very Active—Better Times Ahead

By W. H. WOOD, Secretary Brantford Chamber of Commerce

BRANTFORD, Ont.—Unfortunately you place us in a rather embarrassing position when you ask what developments have taken place during 1921, because at the present time Brantford has considerable unemployment, due to the fact that the bulk of her industries are engaged in the manufacturing of agricultural implements.

Additions to factories this year have been few and far between. A number however have taken advantage of the opportunity presented through the unemployment period of thoroughly renovating and repairing their plants. This has given work to quite a number of men. A few of the larger establishments are working short time and on the relay system, that is, one group of men may work three days, and another group of men carry on for the next three days and so on. The effort has been made to provide employment first for married men with families.

During the year the Dominion Flour Mills erected an elevator with a capacity of 100,000 bushels. Recently a successful campaign was held during which funds were collected to care for women, children and invalids, who being unable to work may be in need.

Following is a list of the names of recently established industries. Bradley's Machine Shop, Brantford Brass Foundry, Brantford Felt Novelty Co., Brantford Pattern Works, Brantford Washing Machine Co., Canadian Cutlery Co., Canadian Electrical Products Co., Charlton & Hoag Co., Ruddy Mfg. Co., Lockwood Textile Co., Moyer Printing Co., Parisian Knitting Mills, Williams Tool Corporation, Waltham Grinding Wheel Co., Schuler Button Co., and Brant Foundries.

We are not feeling pessimistic, however, because we are hopeful that the situation will soon show signs of improvement, when Brantford can once more show that it is Canada's export manufacturing city.

STRATFORD CANNOT COMPLAIN

No New Factories Have Located in Stratford During 1921, But Several Plants Have Enlarged Their Premises

By A. W. DEACON, Secretary-Manager Stratford Chamber of Commerce

STRATFORD.—Although having no entirely new factories commence operations in 1921, Stratford has progressed in other ways. The Kindel Bed Co., Ltd., and Duftons' Ltd., both enlarged their plants, and are at present working over normal capacity. A new foundry also started operations during the year, and is reported to be making good progress. The textile industry is somewhat quiet, but the remaining industries are all working fairly well to normal conditions.

NEW INDUSTRIES FOR WALKERVILLE

Several Industries Have Started Up During 1921—Cover Quite a Varied Field—Business Outlook is Good

By F. MACLURE SCLANDERS, Commissioner of Border Chamber of Commerce

WALKERVILLE.—Several new industries have started up in Walkerville during 1921. These cover quite a varied field, and the following list gives the names of these new firms and their lines of manufacture.

Canadian Name Plate Co., manufacturers of all sorts of name plates, etc.; Crown Battery Service, this firm handling batteries and service in connection with the same; Dodge Bros., where the Dodge car will be partly made and assembled; Fournier Mfg. Co., manufacturers of gas heaters, sink valves, etc.; McLennan Chemical Co., washing fluids; J. D. McMullan, proto engraver; Reo Motor Car Co., also a part manufacture and part assembly proposition; Atlas Chemical Co., various sorts of chemicals; Peter Smith Heater Co., street car heaters, etc.; Frontenac Pattern Works, makers of all sorts of patterns; Canadian Automatic Barrel Machinery Co.; also the Universal Metal Products Co., makers of bath tubs, etc.

Two of the above concerns, while not actually in Walkerville, are in the surrounding districts, and come under the same heading.

GUELPH HAS BEEN GOING NICELY

Various Additions to Existing Plants Have Taken Place—Two New Industries Have Located in Guelph

By H. WESTOBY, Secretary Guelph Chamber of Commerce

GUELPH.—Although there have not been many new additions to Guelph industries during the current year, things have been going along nicely.

The Schnarr Screw and Bolt Co., and J. T. Arnold & Sons are the only two new industries actually secured. The Canada Ingot Iron Co. completed in the spring of this year its new factory, and is now occupying it. The Gilson Mfg. Co. also completed in the spring of this year a large addition to their premises, which they occupied during the summer. We have at the present time 129 industries in Guelph, employing 3,005 employees, and manufacturing some thirteen million dollars' worth of material of different kinds in each year. The industrial situation in this city is exceptionally good, and president E. W. Beattie of the C.P.R. during a recent visit, stated that Guelph was the one bright spot in Ontario. The textile industries are exceptionally busy, as are also the rubber companies, but the iron and steel industries are showing a tendency to slacken off.

We are doing a large amount of work at the present time, such as reconstructing the street railway, and during this summer an unusually large amount of street paving has been gone on with, and as a consequence there is practically no unemployment in the city, and we are all looking forward to the incoming winter with complacency.

BRANDON'S BUILDING ACTIVE

Permits For Year Have Totalled Close to $1,000,000—Several Firms Establish Offices

By H. L. CRAWFORD, Secretary Brandon Board of Trade

BRANDON, Man.—The past year in this city has been noted for its great building activity, and for the fact that building permits during the year totalled close to $1,000,000. Several large firms have established offices here during the past twelve months, the Imperial Oil, Massey-Harris Co. Ltd., and the Western Grocers Ltd., being among the largest of the firms to locate. The Imperial Oil Company erected a plant costing $350,000, while the Massey-Harris people took over the large Gordon Mackay building, and are using Brandon's advantageous position as a distributing point for the company's machinery in the west.

A large iron foundry will probably open here within a few months' time, arrangements being made for the purchase of the Manitoba Engines Ltd. The Hanbury box factory will also open at the commencement of the new year, and many smaller firms have moved to this city and have commenced business. Prominent among the extensions made by large local firms, were the additions to the Massin Fur Company, and Nation and Shewan's Ltd.

Realizing the importance of Brandon's position as an agricultural centre, the provincial government rendered assistance to the Winter Fair Association, and the result is a new winter fair arena costing in the neighborhood of $150,000. The L. R. Steel Company has purchased a site in this city, but their offices have not been opened, although it is stated that the company intends starting business early in the new year.

WINNIPEG REPORTS GOOD PROGRESS

Various Important Undertakings Have Been Gone On With—Large Power Plant Activities Are Under Way

By W. E. MILNER, Managing Secretary Winnipeg Board of Trade

WINNIPEG.—Two important undertakings linked up with the industrial expansion of Winnipeg are the extension to the City of Winnipeg Power plant on the Winnipeg River, giving an additional capacity of 30,000 h.p. and increasing the capacity to 60,000 h.p. The Manitoba Power Co. have also commenced operations on a power plant on the Winnipeg River which will have an ultimate capacity of 168,000 h.p. and will cost $10,000. The first unit to be constructed this year, will be capable of producing 28,000 h.p., although the work to be carried on will complete the plant to a stage where additional expansion will only necessitate the installation of machinery.

Among the largest contracts of the year in downtown Winnipeg are: the addition to the Olympia Hotel, $200,000; the Manitoba Medical College, costing $175,000; Aberdeen School, $190,000; addition to the Union Bank of Canada, $120,000; warehouse, costing $100,000. Following are several of the largest undertakings of the year:

Olympia Hotel at cost of $200,000; school work, $645,000; stores erected, $78,000; warehouses built, $314,000; garages, $84,000; alteration to large restaurant, $75,000; club houses, $38,000; mission hall, $29,000; theatre, $260,000, and a bank building at $120,000. Of course these are only a few items, and comprise but twenty- seven projects.

SASKATOON ADDS TO SIZE

Number of New Shops and Industries Have Opened During Past Two Years, Showing Healthy Growth

By CHAS. T. STACEY, Commissioner of Chamber of Commerce

SASKATOON, Sask.—During the years 1920 and 1921 a number of new industries and shops have been opened, showing a healthy growth despite adverse trade conditions generally in recent months. The following is a list of the new business places opened:

Automobile Clearing House, Ltd.—Garage and repair shop; Canadian Motors Ltd.—Auto sales; Saskatchewan Motors Ltd., garage and repair shop; B. Jerd, auto repair shop; Louis Mons & J. E. Faulkner, electric shop and work shop; Wm. Malcolm, shoe repair; W. J. Davis, machine shop; Simmons Ltd., wholesale beds and bedding; R. G. Godfrey, plumbing and heating; Warren Mfg. Co., sash and door factory; Western Granite and Marble Co., Ltd., stone cutters; Hennesay Three Star Garage, auto repairs and garage; A. Stanley Jones Co. Ltd., agricultural implements; Stewart Sheaf Loader Co. Ltd., manufacturing sheaf loaders; E. S. Farewell, candy manufacturing; Consolidated Optical Co. Ltd., optical works; Chas. Lutes & H. I. Sherwood, radiator repair shop; J. C. Comrie, steam laundry; O. Faille, candy manufacturer.

FORT WILLIAM YEAR GOOD

Most of Industrial Plants Have Been Going Fairly Well—Improvements and Extensions Have Been Made

By W. WEBSTER, Secretary Fort William Board of Trade

FORT WILLIAM, Ont.—All industrial plants have been operating constantly during 1921 with the exception of the Canadian Car & Foundry Co. It, too, will be running on car repair orders at an early date. Material is being assembled now.

During the year a pulp plant has been erected by the Fort William Paper Company, with a capacity of 250 tons of dry pulp per day. Operations commenced on April 30th and the plant has been operating continuously ever since. An addition to the grain storage and cleaning elevator, owned by the Northwestern Elevator Company, is at present under construction. The contractors are Barnett & McQueen. There is now being built 1200 feet more or less of break water revetment wall, protecting the water front of the Mission industrial area. The erection of the coal unloading bridge at the plant of the Fort William Coal Dock Company on the Mission Industrial area has been completed.

The live stock industry has been inaugurated here during this fall, 8,000 sheep being housed and fed at present with more to follow. The inducement is that there is an abundance of elevator screenings which can be had for the hauling from elevators.

EXPERIENCE FAIR BUSINESS

Belleville, Owen Sound and Brampton Report Mod erate Conditions — Sydney, C.B. Has Been Quiet But Has Eye on Future.

OWEN SOUND, Ont.—Mr. R. D. Little, secretary of the Owen Sound Board of Trade, reports that there has been very little activity this year. Some of the manufacturing concerns are running to full capacity but others are not employing over 50% of their usual staff. No new industries have started during the past twelve months but it is hoped that the coming year will see some developments.

Belleville.—Mr. Jamieson Bone, President of the Chamber of Commerce, states that there have been no particular developments in Belleville during the past year. It is gratifying, however, that arrangements have almost been completed for a couple of new industries. Some of the manufacturers during the past two or three months have experienced a renewal of export business in machinery connected with the building trade and also in evaporated and canned foods. The hardware manufacturing companies have not as yet experienced any of the depression so common to other trades Two such industries are employing about 100 hands each. They have been running full time for several years and are today fully occupied. They have business in sight to keep them running steadily through the winter.

On behalf of Sydney, Cape Breton, Mr. F. C. Kimber, secretary of the Board of Trade, reports that things have been quiet there. Industrial activity has been quiet during 1921. "All we can say," remarks Mr. Kimber, "is that we have been marking time as cheerfully as we know how and look for better times which we confidently hope are not far away in the future."

Replying from Brampton, Ont., Mr. A. R. Hewetson, secretary-treasurer of J. W. Hewetson Co., Ltd., states that he is not able to report much activity for that town during 1921. In common with other places things have been quiet. At the present time shoe factories are very busy, as is also the rubber factory which is running two shifts. The rest of the industries in Brampton are holding their own under existing conditions.

REGINA IS WELL SATISFIED

Building Permit Record Totalled Close to Two Million Dollars Up to October—Extensions Are Made

By CHAS. A. COOKE, Secretary-Manager Regina Board of Trade

REGINA.—While industrial expansion in Regina during the current year has not been spectacular, the situation as revealed by the building permit record has been eminently satisfactory. To the end of October permits totalled within a few dollars of two millions, and for the complete calendar year will exceed that mark.

Residential construction has been the predominant factor, though several commercial and educational enterprises have helped to swell the total. New business premises have been erected by Bowman Bros., Ltd., for the distribution of auto accessories. Campion College, erected by the Catholic community, entailed a cost of $200,000. The stone-cutting plant of Alex Young, Ltd., has been rebuilt.

Extensive changes have been effected in the refining plant of Imperial Oil, Ltd., some $750,000 having been expended in the conversion of the system into a continuous operation plant, and in the perfecting of the condenser system. Over four hundred residences have also been added to the city during the year.

PETERBOROUGH IN GOOD HUMOR

Three New Industries Have Been Added and Three Others Recently Started Operations—Outlook For 1922

By LEON FRAZER, Secretary of Peterborough Chamber of Commerce

PETERBOROUGH, Ont.—The general trade depression has had a direct effect on the establishment of new industries in this city, but nevertheless we are pleased that during 1921 several industries have been added to our list and are now in operation. They are the Canadian Tent and Awning Company, canvas goods; Canadian Sanitary Ice Supply, manufactured ice; Elliot Mfg. Company, Ellico Wool. The following companies have also just recently commenced operations:—

The Red Arrow Tires, Limited, cord and fabric tires and inner tubes; Birmingham Motors, non-axle cars; Alliance Brass Company, Ltd., brass castings.

During the year the Canadian General Electric Company

and the Canadian Packing Company have made considerable extensions to their plants. It is our firm belief that with the general trend towards normalcy a marked increase in the location of manufacturing concerns will be the experience of 1922.

ST. CATHARINES GETS INDUSTRIES

Locates Two During Past Year — While Older Firms Are Quiet—Indications Point to Increased Activity

By M. M. MAXWELL, Manager Chamber of Commerce

ST. CATHARINES, Ont.—As to industrial development we can report that during 1921 two industries have located here. They are the Guaranty Dyeing & Finishing Co., Ltd., whose line of work is the dyeing and finishing of silk fabrics including broad silks, piece goods and artificial silks, etc., and a motor truck industry who expect to commence operations soon.

With regard to the older industries, most of these are operating with a reduced staff but indications point to an increased activity in the near future. One firm is expecting to operate at full capacity very soon.

SEVERAL DEVELOPMENTS IN SARNIA

Air Pumps For Automobiles Now Manufactured—Artificial Ice Plant Opened Up—Other Moves of Interest

By GEO. P. FRANCE, Managing Director Sarnia Chamber of Commerce

SARNIA.—During 1921 several developments have taken place in Sarnia. The National Engineering Co., manufacturers of air pumps for automobiles and creamery equipment started operations during this year, and the Holmes Foundry Co., who produce grey iron castings for automobiles, almost doubled their capacity.

The W. D. Ferguson, artificial ice, opened up in 1921; the Sarnia Cement Products, makers of cement blocks, tiles, etc., commenced operations, and the Hayne Cooperage Co. moved their plant from Brigden to Point Edward, and commenced work during this year.

CHATHAM SEES FEW CHANGES

Although No New Industries of Note Have Opened Up the Regular Plants Have Been Working Steadily

By W. R. LONDON, Chatham Chamber of Commerce

CHATHAM.—Although the regular industries have been going in good fashion, the year 1921 has brought only the following changes:

The Mack Furnace Co. are now making a line of hot air furnaces, and the International Harvester Co. of Canada have taken on at their local plant the manufacture of speed trucks. This line will now be made in Canada and distributed from Chatham instead of being manufactured in the United States as heretofore.

NEW ENTERPRISES FOR VICTORIA

Varied Lines Have Started Up, These Including Fish—Toys—Gramophones—Concrete Blocks, etc.

By A. GORDON SCOTT, Secretary of Victoria Chamber of Commerce

VICTORIA.—Several new enterprises have been established in Victoria during the current year. Following are the firms which have commenced operations in 1921, together with their lines of manufacture:—

The Wholesale Fish Co., fish canning; Veterans' Product Co., fish fertilizer; Henson & Dyson, concrete blocks; Canadian Abrasive Paper Co., sandpaper; B. C. Yacht & Boat Builders, boat building; Hiker Manufacturing Co., mechanical toys; P. E. George, gramophones; Victory Attachable Rubber Soles and Heels Co., rubber soles and heels; Canadian Western Woodworkers, wood-working; Henshall Fish Products (Sooke, B.C.), fish by-products; and the Sidney Roofing and Paper Co., roofing paper, etc.

SOME FEATURES OF THE PRESENT BANKING SITUATION IN CANADA

Canadian Banks Have Been Very Fortunate When Compared With Those of Other Countries —Premium on New York Funds Will Not Disappear Immediately

By SIR FREDERICK WILLIAMS TAYLOR, President of Bank of Montreal

THE BANKING world is passing through the most troubled period in its history, but it is fortunate that this state of affairs has been unattended by financial panic. Inevitably, losses brought about through the unprecedented drop in the price of commodities and the heavy decline in the market value of securities have in many instances fallen indirectly upon the banks.

More money has been lost by foreign banking institutions operating in certain directions abroad than ever before in a similar period in any country. I think it may be asserted that in Canada banks generally have been fortunate when compared with those of other countries, and while doubtless all Canadian banks have lost money in loan accounts that have "gone bad" during the past year, no disaster has developed.

A year ago the inflation in trade was at its height, as is demonstrated by the fact that the aggregate loans in Canada of Canadian banks were 80.8 per cent. of their total deposits within the Dominion. The latest figures available show the ratio as 77.5 per cent.

Trade Deflation

The subject of trade deflation has become a world-wide theme, but the trouble is that many of our merchants and manufacturers simply cannot deflate at present. The demand for their goods has disappeared, while money borrowed from the banks in anticipation of sales cannot be repaid—hence what are termed "frozen credits." Bank loans in many cases have thus become fixed, and the liquid surplus in mercantile balance sheets represented by inventories has, for the time being, lost its true meaning. As usual, the banks have come to the rescue, and, speaking for the institution which the writer has the honor to represent, we have maintained to the limit of prudence our well known and century-old policy of carrying deserving customers in difficult times.

The premium on New York funds is still with us, with little prospect of departure in the near future. The rate is but 8 per cent. as compared with 15 per cent. on the 5th December, 1920. The fact that Canadians have become accustomed to the penalty of doing business abroad with an inferior domestic dollar, does not alter the fact that Canada is at a very serious disadvantage indeed in its monetary dealings with the United States of America.

I shall not go into the matter except to say that the premium on New York funds will not disappear until we buy many millions less of goods and materials abroad or increase our exports. The premium would have been higher had it not been that Canada, as stated elsewhere, has borrowed in the United States this year $144,000,000, which sum, so far as exchange is concerned, must be added to our exports or deducted from our imports.

Every Canadian should understand, however, that this is merely alleviation, not cure. Economically, it would be far better than we should borrow within our own borders. By borrowing abroad we add steadily to the already great sum of interest on our foreign obligations annually sent out of the country, the capital amount aggregating nearly $3,500,000,000.

Canada's Immigration Outlook

by

Robert J. C. Stead
DIRECTOR OF PUBLICITY
DEPARTMENT OF IMMIGRATION AND COLONIZATION

FREDERICK A. WALLIS, United States Commissioner of Immigration for the port of New York, in a recent article has the following to say about world immigration conditions:—"Europe, with 3,312,613 square miles of land, has 120 persons to the square mile; Asia, with 17,206,000 square miles, has 50.7 persons to the square mile; Africa with 11,622,619 square miles of territory, has 12.3 persons to the square mile; Australia, with 3,312,613 square miles, has 4.9 inhabitants to the square mile; the Polar Regions have 5,081,935 square miles with no population; North America, with 8,589,527 square miles of land, has a population of 150,000,000, or 16.3 inhabitants to the square mile, and South America, with 7,570,015 square miles, has 7.4 persons to the square mile.

"In the contemplation of this distribution of the earth's population, two conclusions may be drawn, which lead directly to the lesson of immigration in the modern world. Europe has 91 persons to the square mile more than the world's average, while North America, peculiarly blessed with earthly resources of great wealth, has 13 persons to the square mile less than the earth's average.

"Belgium has 637 people to the square mile, while many of our Western states are so sparsley populated as to be amusing by comparison.

"The records of the last few weeks show that Texas has 17.5 people to the square mile, Washington only 19.6, Oregon 8.1, and Arizona 2.92.

"It takes no prophet to foretell that in the operation of Nature's great law of equalization, the trend of immigration will continue, as it has been for many years past, to be from Europe to the Americas.

"It requires no science of logarithms and differential calculus to estimate that, even should immigrants come to this country at the rate of a million per annum, it would require centuries to bring about an equality with Europe in the matter of population to the square mile."

All that Mr. Wallis says about world conditions in the immigration movement applies to Canada, only more so. If the United States, with about thirty-three persons per square mile, must expect a continued movement of population from the more densely settled countries of the world, how much more so shall Canada, with less than three persons to the square mile, expect such a movement? The point of this argument is not dulled by suggesting that a considerable portion of Canada's area is unsuitable for habitation. It is not so generally accepted as it used to be that there is a very considerable portion of Canada's area unsuitable for habitation; certainly the area incapable of supporting human life is very much smaller than was at one time supposed. Within a short lifetime we have seen the wheat growing centre move from the international boundary northward until in the present year probably the greatest wheat crops in Canada were harvested in the Peace River and Grande Prairie districts, and far beyond the utmost range of wheat-growing the cultivation of fodder crops, the dairying and livestock industries, can be carried on with success.

Land For Farming

A conservative estimate places the amount of land in Canada fit for farming purposes at 300,000,000 acres, of which only about 50,000,000 acres are as yet under cultivation. It is therefore apparent that Canada can support an agricultural population six times as great as at present even without making allowance for the greater intensity of agriculture which always accompanies population.

If these facts are facts, if Canada can support six times

A group of immigrants arriving at Quebec.

as many farmers as at present—with, of course, a proportionate increase in urban population—it is apparent that the immigration problem is one which we have with us whether we wish it or not. The people of the congested areas of the world, where life can be maintained only by the most unceasing effort and even then on a comparatively low plane, are not going to look uncovetously toward a land where the opportunities for making a livelihood have as yet been developed to only, let us say, about one-sixth of their possibilities. Canada must face an immigration problem whether she wishes it or not.

But there is no reason why Canada should not face such a problem with confidence and optimism. In that problem lies the solution of most of her other problems. Let her solve the immigration problem and the other problems in a large degree disappear of their own accord. It is perhaps not necessary to elaborate that in this article, but two brief but authoritative quotations may be made.

Mr. E. W. Beatty, President of the Canadian Pacific Railway: "It is I think a fact that the two great necessities for this country's advancement, namely, the obtaining of suitable settlers in as large numbers as possible and the attraction of capital for the extension of Canadian enterprise, should be given the most serious consideration now, and not later."

Sir Joseph Flavelle to the Toronto Board of Trade, as reported in the press October 5th, 1921: "I confess to a sense of deep surprise that there is so little aroused public opinion either in government or trade circles or in the press that the one and only remedy for this situation which takes millions of dollars of good money every week and pitches it away is more people, greater production, greater tonnage, more passengers."

From the excerpts which have just been quoted as the opinions of prominent students of Canadian conditions it is evident that not only Canada's future prosperity but the solution of a number of problems which this country now has on its hands is inseparably tied up with the immigration problem. Now, what, exactly, is Canada's immigration problem?

It may be stated in a word that Canada's immigration problem is assimilation. If we could imagine a state in which assimilation was unnecessary then we would have little or no immigration problem, but where there is immigration there can be no united and homogeneous nationality without assimilation. The speed at which we are able to assimilate newcomers is the limit which has to be placed upon immigration operations.

Assimilation takes two forms: industrial and social. The industrial form is perhaps the most obvious. Unless labor can be found for the immigrant, profitable both to himself and his employer, and without dislocating the relation of other workers to their employment, the immigrant is a help neither to himself nor to the country. It cannot be too strongly stressed that what Canada needs, fundamentally, is not immigration, but production. The immigrant is welcomed as a means to that end. If he is not a producer he is an increased liability rather than an asset.

Social Assimilation

Social assimilation of the immigrant is a more abstract but even a more important matter than industrial assimilation. It means absorbing him into the social body of Canada. It is a finer, more delicate and more far-reaching process than industrial assimilation. It is accomplished only by imbuing a newcomer with Canadian ideals. And here let me say, parenthetically, that it is quite impossible to imbue a newcomer with Canadian ideals unless there are well pronounced Canadian ideals. This thought might easily lead one into a discussion upon the necessity of a reorganized idealism, which can only be built up through a Canadian literature, as the basic necessity in assimilation, but that is a thought probably foreign to the principal purpose of this article.

Canada's problems of assimilation, while great, need not be at all disheartening. We possess certain unique advantages. Our people are themselves bilingual, and the process of assimilation can therefore be carried on both in English and in French. Moreover we possess a great advantage as compared with the United States, for example, in the fact that our immigrants are not necessarily foreigners. Every immigrant who enters the United States is a foreigner, but this is not true of Canada. A large proportion of our immigrants experience no change in their national allegiance when they become Canadian citizens. They are of British stock and

Top View shows farmer's home in Clover Bar District, Edmonton. Owner came to Canada from Old Country only a few years ago, and began on a homestead.

The Lower View shows a farm at Nokomis, Sask. In this case the owner came to Canada 15 years ago with only $500 capital. His farm is now valued at over $50,000.

their assimilation is a comparatively simple matter. Another large source of our immigration is the United States, and while technically the American is a foreigner in Canada, actually he is not. He is not regarded as a foreigner by the Canadian people. He is regarded as a member of the same race although possibly of a different branch of the race.

These facts help make Canada's problem of assimilation easy and they also lie at the basis of much of Canada's immigration policy. Our active efforts to obtain settlers are mostly confined entirely to the two sources of immigration just referred to. There is naturally and inevitably more or less immigration from other countries as well, much of which is of a highly desirable nature, such as that which springs from France, Belgium, and the Scandinavian countries. Of our total immigration of 148,477 for the fiscal year ended March 31st, 1921, 47,687 were English, 6,384 Irish, 19,248 Scotch, 943 Welsh, 1,645 Belgian, 861 French, 1,042 from Newfoundland. 1,705 Scandinavian, 595 Dutch, 235 Swiss and 48,169 from the United States. It is therefore seen that our immigration, except for a comparatively small proportion, springs from the particularly favorable sources which have been mentioned.

It need hardly be added that the fact that Canada's immigration comes so largely from such favorable sources has not come about by accident. It is the result of the cultivation of desirable fields no less than of restrictions enforced against undesirable individuals no matter from what country they may come. The Canadian immigration regulations are based on the theory that Canada is entitled to the best possible type of citizen. These rules are applied as humanely as possible, but always with the recognition of the fact that the interests of Canada as a whole are greater than the interests of any individual.

What Course Should Be Taken?

Just what course Canada's immigration activities in the future will take will undoubtedly be governed to some extent by the conditions which arise. Since the war conditions have been such that extreme care had to be taken in the working out of any policies. As the people of the world settle into more fixed and dependable attitudes toward each other and the world as a whole, policies extending over greater groups and over longer periods will be possible.

One relatively new phase in the situation can hardly be overlooked. Until recent years Canada was in a position to offer free government land to all who would undertake to become settlers upon it. There are still large areas of free government lands, but for the most part they are now more or less inaccessible to railways and their settlement would necessitate the extension of our already somewhat elaborate railway system. If the settler, therefore, can no longer be offered the advantage of free land, and if the fact is recognized that to start on any other basis demands capital, a new and difficult problem is injected into immigration matters. It is a problem which is worthy of most serious consideration by the Canadian people, and the ability which they have shown in solving other problems leaves no question but that they will find a method of dealing with this new condition in such a way as to promote the general prosperity of the country and to permit of the assimilation of immigrants of the more desirable class in increasing numbers from year to year.

Recutting Silver Spoon Dies

Obsolete dies used in the manufacture of silver spoons are sometimes reclaimed for new patterns by cutting off the face of the die. The removal of 1-4 inch of steel, usually eliminates the old pattern and presents a new face for engraving the new pattern. Economies such as this may seem to be of trivial importance but to the large manufacturer of silverware they are well worth consideration in the aggregate. Not only can an old die be reclaimed and prepared for re-engraving at small cost but the problem of scrapping obsolete patterns is disposed of.

Heat Treatment of Dies

(1) The commonly accepted view that hammering expends itself on the outside of a forging whereas pressing penetrates the whole substance of the forging is erroneous.

(2) In forging between plain pallets, whether by blows or pressure, the metal tends to flow outwards parallel with the faces of the pallets.

The layer of metal next to the pallet, however, is restrained by the surface friction and the surface cooling action of the pallets, and this layer in turn restrains a smaller area of the layer next to it, and so on. Thus a prism or pyramid is built up on each pallet of metal which does not flow to any great extent, the base of the prism being that portion of the pallet which is in contact with the metal.

(3) The boundaries of these prisms are more definitely marked in the case of blows than in the case of pressure, and at a certain point when forging is carried on either at extreme velocity or at a low temperature, the metal "slips" or "shears" on the surface of the prism, creating local heat, which is often visible on the outside of the forging.

(4) In bars of square section or in which the height is not more than the width of the pallet in contact with the metal the upper and lower prisms meet near the centre of the bar. As, therefore, the main vertical force is transmitted through the prisms and these grow smaller in area as the distance from the pallet increases, it follows that the pressure per unit area increases towards the centre. As a consequence the horizontal flow of metal is greater near the centre of the bar and there is a greater thinning action in the central horizontal layers of the metal.

It follows from this that the ends or exterior surfaces of the forging will assume a convex form.

(5) The surface friction of the pallets is about the same under the press and hammer, but decreases slightly as the number of blows or squeezes increases.

(6) The surface cooling action is greater in the case of the press than in the case of the hammer, because of the longer time the pallets are in close contact with the forging.

(7) In bars or forgings in which the height is greater than the width of the pallet in contact with the metal, the top and bottom prisms do not meet and the metal between their apices is in tension. The exterior surface will therefore be convex at points horizontally opposite the apices of the prisms and concave between these points.

(8) It follows from No. 7 that if a forging of circular section be forged between flat pallets, only a narrow portion of the pallet being in contact at each blow or squeeze, the centre will always be in tension and the end will be concave for the most part, but convex in a ring all round the outside This results in a "piping" action in the centre, the action being more intense the narrower the width of pallet in contact with the metal.

Another way of stating this point is that the further we get away from square forging the more do we put the centre in tension, and therefore introduce a "piping" action.

This action takes place both in pressing and hammering, but is more intense in the case of pressing because of the greater cooling effect.

(9) Forcing in prisms makes the metal bulge out sideways and lengthways, and therefore successive blows on different parts of the bar, but in the same direction, produce a wave formation in the metal.

(10) In bars forged to and fro from end to end, first in one direction and then in a direction at right angles to the first, these waves tend to neutralize one another.

(These are a few of the principal points brought out by Harold F. Massey, B. Sc. M. I., Mech. E., in a paper which was presented at Manchester, England).

An interesting sidelight on the iron situation in Canada is the fact that a very small percentage,—less than five per cent.—of the large consumption of iron and steel is derived from our own domestic resources. Important deposits are found in Ontario, Nova Scotia, New Brunswick, Quebec, British Columbia. Present economic conditions interfere with their development.

Canada's Record For The Past Decade

Agricultural, Industrial and Commercial Development During Last Ten Years Has Been Wonderful—Canada is Well Equipped to Continue on Her Forward March of Progress

By Norman S. Rankine
Editor, Agricultural and Industrial Progress in Canada

CANADA'S RECORD of agricultural, industrial and commercial development during the past ten years, has been one of remarkable progress. From the comparatively insignificant status that she occupied amongst the nations of the world in 1910, she has achieved, largely as a result of her participation in the great war and consequent industrial activity and expansion, a position of international importance which the spirit of her people will uphold and extend.

For Canadians have a distinct national spirit; of that there is no doubt; a spirit of active and serious aggressiveness engendered possibly through a knowledge of their accomplishments in the past, of their country's stirring history and struggle to Confederation, and of life in a healthy, energy-arousing climate which produces the very sturdiest manhood and womanhood. If there exists, in the mind of any, doubt as to her ability to continue the forward march of progress and to execute complete economic reconstruction, it should be swept away in the thought of her splendid war record—both at home and abroad—for of all countries that participated in the European Maelstrom, Canada emerged in the most favorable financial condition. What she has done under stress and trial of conflict she can most assuredly carry out in the tranquil times of peace.

Year by year Canadian affairs are commanding increased interest in foreign countries. Readers of foreign newspapers and periodicals know this to be so. Today, in the press of many countries of the world is to be found increasing news of Canada and her activities—financial, industrial, political or otherwise, and particularly is that so in Great Britain and the United States, with which countries Canada has, naturally, the closest trade and financial relations.

A comprehensive survey of Canada's progress during the period under discussion is, of course, out of the question in the brief space of this article. The student of Canadian affairs, if he desires to go into them deeply and fully, must turn to governmental or other hand-books, where he will find, in their statistical data, a record of growth and augmentation which should be at once a source of satisfaction and pleasure. He will find that he has been participating in the upbuilding of a richly endowed country whose march towards that maturity which all Canadians desire, has been both steady and rapid.

Canada's Progress In Ten Years

1910		1920
6,917,000	Population	9,000,000
37,087,388	Crop Producing Acreage	53,050,000
132,077,547	Wheat Production (bus.)	263,189,300
12,082,077	Cattle, Horses, Swine (No.)	15,517,000
2,379	Bank Branches	4,921
24,731	Railway Mileage	38,896
$1,118,694,000*	Agricultural Production	$1,946,648,000
1,247,583,609	Invested in Manufactures	3,034,301,000
106,823,623	Mining Production	217,775,080
29,965,433	Value of Fish Catch	49,321,217
98,789,929	Bank Capital	124,250,338
909,964,839	Bank Deposits	2,228,332,268
298,763,993	Exports	1,287,000,000
369,815,427	Imports	1,064,000,000
101,503,711	Public Revenue	451,336,000

* (1915)

Canada's first industry is agriculture. The total estimated agricultural wealth of the Dominion, according to the Monthly Bureau of Agricultural Statistics, amounted in 1920 to $7,612,151,000 exclusive of certain other miscellaneous products which increase this value a further $23,000,000.

Canadian crop producing acreage in 1910 but slightly exceeded 37,000,000; in 1920 they had jumped to 53,000,000. In the same period, wheat production increased from 132,000,000 bushels to 263,000,000 with respective values of $113,000,000 and $427,360,000. According to the estimates of the International Institute of Agriculture, Canada now occupies second place in the list of world's wheat producers, being only exceeded by the United States. It is expected that the quantity of grain shipped through the port of Montreal this season will approximate 132,000,000 bushels, which is double the

Canadian Products Sent Into World's Markets.

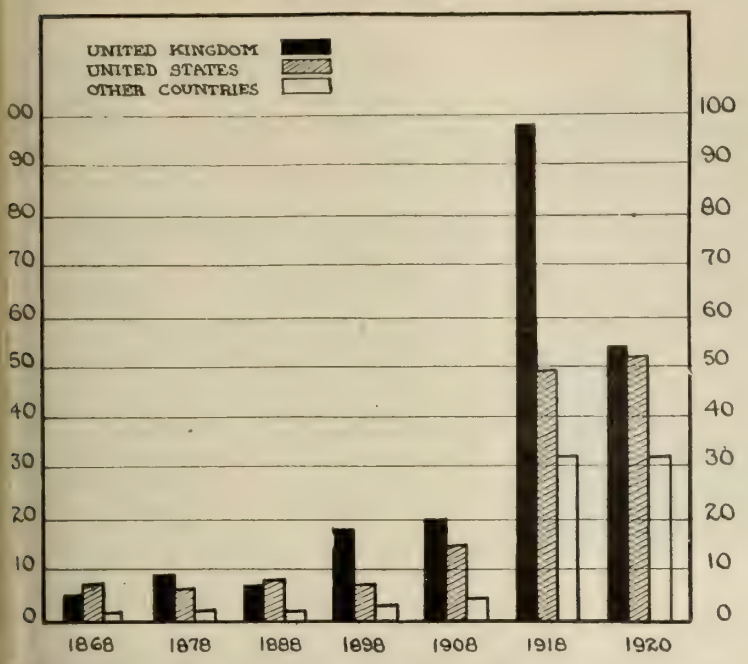

Chart showing value of products sent into world's markets since 1868.

quantity for any previous year. From this we see that Canada is stepping ahead quite nicely.

The value of total agricultural production has increased by over $700,000,000 in the past six years. Since 1910, the three Western Provinces of Alberta, Saskatchewan, and Manitoba, have held the world's wheat championship between them. Eight grand championships have been captured in this period for six of which the "Wheat Wizard," Seager Wheeler, whose name is widely known to all agriculturists, is directly responsible. Prizes for oats, barley and livestock have also become an annual occurrence.

Following the earlier northward march of the wheat belt, the corn belt has apparently crossed the international boundary and gives promise of becoming a staple product of the Canadian West, much to the surprise of the corn growers of the United States.

Horses, cattle and swine have increased from over 12,000,000 to 15,517,000.

The Western prairies, once treeless and bald, are rapidly ceasing to be so, bringing to the farms of the settlers, not only shelter and shade for man and beast, but to the homes, that charm and picturesqueness so typical of the East, and and which only green foliage can impart.

Announcement is now made from one nursery in Saskatchewan that six million trees,—poplars, Russian poplars and caraganas—will be distributed amongst farmers in that province alone next spring.

Good roads also, rapidly constructed and extended, have brought the producer into greater proximity with the markets an added to social intercourse and educational opportunity. While in 1910 there were but few automobiles throughout Western Canada—particularly in the hands of the farmer—a survey at the end of the next decade indicates one car to every twenty-five of the Dominion's total population. Latest figures increase this to one in every eighteen.

Banks Have Expanded

Canadian banks have expanded widely. A decade ago their paid-up capital stood at $98,789,929; in 1920 it reached $124,251,000. Bank deposits—an indication of thrift and prosperity—increased from $909,964,839 to $2,228,332,268 and bank branches from 2379 to 4921 (June 1st.) Canadian banks have manifested an aggressive spirit of extension and established branches in the United States, West Indies, Central and South America, Europe and the Orient. They have inaugurated departments of foreign trade and bureaux of information where all available information is on file at the disposition of their clients, both at home and abroad. Many of them issue handsome weekly and monthly literature of a decidedly interesting and informative character.

In 1910 the public revenue was $101,503,711; in 1920 $451,336 000. Exports and imports were $298,763,993 and $369,815,247 respectively as against $1,287,000,000 and $1,064,000,000, last year's figures.

Mining production has grown from $160,823,623 to $217,775,080. Canada with but one-half of one per cent of the world's population produces 90% of its cobalt, 88% of its asbestos, 85% of its nickel, 12% of its silver, and 4% of its gold and copper.

There was invested in manufacturies ten years ago the sum of $1,247,583,609; at the present time, $3,034,301,000. It is interesting to note that whereas prior to the war there were but some 400 branches of United States industries established in Canada, by 1920 these had increased to approximately 600 and are to-day over 700, with an interest, across the border, growing in intensity as manufacturers and business men realize the advantages to be derived by following in the footsteps of their predecessors. In addition, many British industries have become established here.

A typical farming scene on a Canadian farm.

The value of fish products grew from $29,965,433 to $49,-321,217 while capital invested in fisheries is placed at $29,-633,359.

As is well known, the population at this time approximates nine million—an increase of about two million since the past census. The war had its effect on immigration which dropped from over 400,000 in the fiscal year of 1913 to 48, 537 in 1915, rose slightly in the years 1917 and 1918, slipped back to 57,702 in 1919 and increased to 1,177,336 in 1920. Immigration is a vital subject to Canada at the present time and owing to the Government maintenance of the restrictions act, has fallen off tremendously. Much comment is being now devoted to the subject in the Canadian press and it is apparent that it will be the duty of the incoming government to inaugurate a more constructive policy. Australia, New Zealand and South Africa are actively engaged in soliciting British immigration.

Great strides have been effected in irrigation. Whereas ten years ago, with exception of some small private schemes, of inconsiderable extent, no watered lands were available to the farmer, although surveys of large bodies had been effected in the early nineties. In 1920 there was in Southern Alberta an irrigable area of close to one million acres and surveys covering a further 600,000 acres have been undertaken of which 114,500 are in course of construction.

Progress In Many Lines

The progress of the pulp and paper industry during the past decade has been phenomenal. When the last survey was conducted by the Dominion Bureau of Statistics in 1919, it was found that a total of $264,581,300 was invested in the industry, $69,896,588 being invested in pulp and paper mills, $16,533 276 in paper mills and $178,131,436 in pulp and paper mills. There were 99 mills, 33 paper, 39 pulp and paper mills. In the year 1881 Canada had but 5 paper mills with capital of $92,000 and an annual output of $63,000.

Another industry in which there has been great advancement is that of automobiles. At the end of the year 1919 there was an investment of $57,000,000 in the industry in 1289 plants, scattered through the country, Ontario greatly leading with one half the total plants.

The development of the fur trade dates from the early days of French regime when a monopoly of it lay in the hands of the Hudson Bay Co. It is only of recent years that attention has been given the fur farming industry and periodical fur auctions established at Montreal and Winnipeg. Buyers were attracted from all parts of the globe and their establishment of these auctions as permanent institutions is apparently accomplished, rivalling those of New York, St. Louis, London and other centers.

The year 1919 saw the first survey of the domestic industry. At the end of 1920, there was found to be 582 fur farms in operation in comparison with 419 in the previous year. In this space of time, the value of animals had increased by 50 per cent to $4,632,605. There were 573 fox farms as compared with 414 the previous December. Land and buildings on the fur farms were valued at $1,178,788. The silver fox has made Prince Edward Island famous. All these things have been accomplished in the short space of time under discussion.

What the next decade will bring to Canada is for time to tell. It cannot however, be doubted that Canada's progress will continue with increasing velocity. The great natural resources of the country—of which the main one is agriculture—are yet relatively unexploited. In the Canadian West alone, but one-fifth of its declared available cultivable area is occupied, while 300,000,000 acres await the hand of the husbandman, 34,000,000 of which are within 15 miles of existing railroads. There are many vacant farms in Eastern Canada which should be again settled and Canada is one of the few remaining countries which offers fertile lands on terms within the means of settlers of limited means, located in a land of democratic self-government and a climate acceptable and desirable to the white race. With the development of this vast area of farm lands, a corresponding extension in industry, commerce and all that goes to the building of a great nation, must accrue.

Unsolicited Praise

From M. R. MELDRUM
Morr's Crane & Hoist Co., Niagara Falls, Ont.

"WE ARE PLEASED to note that your Annual Review number is taking complete form," wrote the above gentleman a short time ago, and as the remainder of his letter contained so many points of interest, we take the liberty of publishing it verbatim.

"We think this number is very useful to the engineering world of Canada," continued Mr. Meldrum, "and we believe you should be encouraged to extend your editorial services as well as the publishing of special articles on timely subjects. In our opinion the future of industrial Canada is such as to warrant manufacturers in making ample preparation for big production in days which are not far distant. By this we do not suggest a lavish spending with little preliminary study such as characterized the war, now happily over.

"Every expenditure on capital account should be made only after the closest consideration and discussion between purchasing and engineering departments. The experience of Henry Ford and other manufacturers has shown that there is room for wonderful economies in production, organization and machinery. Our own business brings us directly in contact with this side of industrial life and it has been a matter of surprise even to us how much time and money can be saved in certain cases by the use of special or standard lifting and transporting machinery.

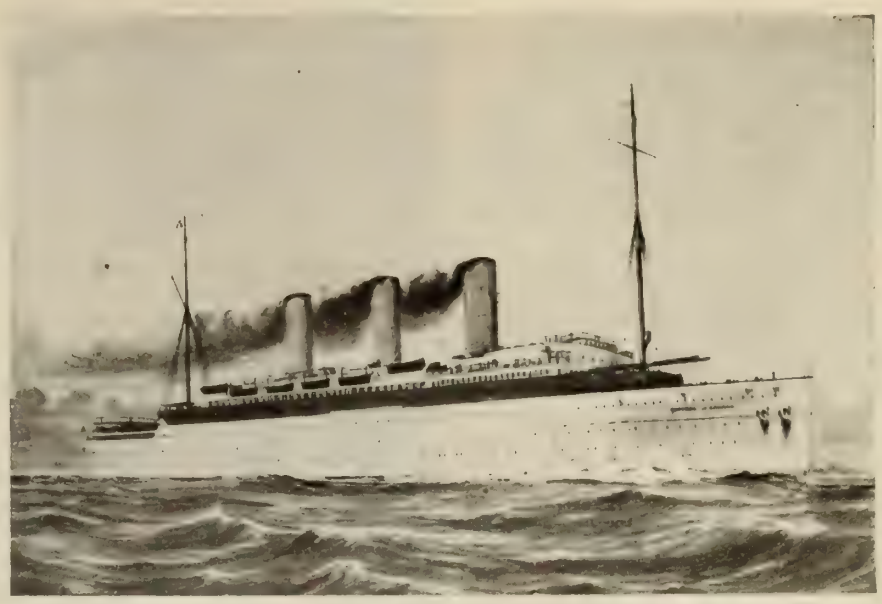
"The same remarks apply to a greater or less extent to almost every piece of plant equipment. Every day invention is placing at the service of the producer some more direct, more economical and more efficient means of manufacturing certain of the components entering into a finished product. These developments should be seized upon, and obsolete, time-wasting equipment relegated to the scrap heap.

"If such a policy is put into effect by individual manufacturers it will be a great benefit to our country. It would be greater benefit to Canada for our municipalities and our provincial and Dominion Governments to adopt similar policies of efficiency and economy. The amount of money annually wasted would be sufficient to finance a tremendous selling campaign covering the whole of the world which would provide an outlet for the products of all existing Canadian factories and induce expansion on all hands. We have every confidence in the future of this country if we can avoid restrictive legislation on the one hand, and unreasonable demands of individual classes on the other hand."

Addition of Aluminum

During the war a very small percentage of aluminum was sometimes used with cast iron in the making of munitions. This was done to prevent microscopic shrinkage cracks in the surface of castings that otherwise would have formed when the casting cooled.

China's Cotton Spinning Industry



Twenty years ago China's cotton spinning industry was represented by two mills with 65,000 spindles; in 1902 the numbers had increased respectively to seventeen and 656,000; in 1920 they were sixty-three and 1,422,832. Some twenty additional mills are under construction or projected. There are four British-owned cotton mills in Shanghai with 248,756 spindles, while the Japanese are credited with sixteen mills and 469,000 spindles. "Speaking generally," says Engineering, "on account of Chinese cotton being of short staple, the Chinese mills have so far confined themselves to the production of yarn, but looms have been installed in some of the larger mills on which a fair amount of cloth is being produced. These cloths compete successfully with similar cloths from Japan, but there does not seem to be any likelihood of the Chinese being able to produce anything approaching the Lancashire textiles for many years to come. The Chinese Government has an arrangement in the matter of remission of taxation which is of great benefit to the native product.

Holding Export Trade

Thoroughness is Very Essential—Keep Goods Up To Quality — Supply Exactly What You Promised—Even To Seeming Trifles Like Labels, Etc.

By F. C. T. O'HARA

Deputy Minister Department of Trade and Commerce.

FEW persons realize how diversified are the functions of the Department of Trade and Commerce. No adequate intimation is conveyed by the title as to the importance of its component parts, or how widespread its activities. The branches as they at present exist may be enumerated as follows: the Board of Grain Commissioners at Fort William, which controls the inspection and weighing of grain; the Gas and Electricity Inspection Branch; the Weights and Measures Inspection Branch; the Dominion Bureau of Statistics, which in addition to compiling trade statistics is responsible for the taking of the decennial census; the Exhibits and Publicity Bureau, in which is included a cinematograph plant; and lastly, the Commercial Intelligence Service.

The foreign trade of Canada must expand rapidly, and it is the policy of the Government to lend all practicable help to its development. To this end the Commercial Intelligence Service was established. The department takes pride in its belief that, all things considered, no finer commercial intelligence service exists to-day throughout the world. This service does not cover so many fields, nor has it so many representatives as others, but man for man few countries, if any, can show a higher and more efficient personnel. It is an essential part of the general scheme of the service that these representatives, Canadian Government Trade Commissioners as they are designated, should be located in foreign countries.

Direct representation is, therefore, now maintained in the following countries: the Argentine Republic, Australia, Belgium, Brazil, British West Indies, China, Cuba, France, Holland, India, Italy, Japan, New Zealand, South Africa, the United Kingdom at London, Manchester, Liverpool, Bristol and Glasgow, and the United States at New York. In addition Mr. L. D. Wilgress, who was at first in Russia, is now on special duty in the course of which he has made a thorough review of the new countries of South Eastern Europe. There are four Commercial Agents at Sydney, N. S.W., Australia; Christiania, Norway; Port of Spain, Trinidad and Nassau, Bahamas.

Subsidiary to these is the assistance which under an arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, may be rendered by the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters. These Consulates are located in the following countries: Chile, Colombia, Ecuador, Egypt India, Mexico Panama, Peru, Portugal, Spain, Sweden, Switzerland, Uruguay and Venezuela.

For the important office of Trade Commissioner, special qualifications are required. It is desirable, for example, that a Trade Commissioner shall have a sound and liberal education, including a thorough knowledge of English, and be endowed with initiative, imagination, energy and enthusiasm. To these qualifications he must add tact, address and pleasing manners. These are considered necessary to equip the commercial intelligence service for its high purpose, and this can only be done by admitting for training those who measure up to the basic qualifications.

The duties of a trade commissioner are exceedingly comprehensive and demand from him a high measure of versatility. He must be familiar with the natural and industrial products of Canada, as well as the character of such commodities as are available for export. He may have to answer questions of a technical nature in relation to a wide range of Canadian products, such as boots and shoes, pianos, railway equipment, electrical material, men's furnishings, canned goods, etc., as well as be able to prepare reports which would furnish information to exporters with respect to all these commodities. In that connection the facts with regard to competition, packing, shipping, customs duties, financing and so on must be within his knowledge.

He must be more than a medium of information. In the event of misunderstandings or disputes between exporters and consignees, he may be called upon to act as an intermediary, and such a duty calls for tact and skill. He must make himself familiar with shipping and railway facilities, as well as the special conditions which attach to foreign markets. Furthermore the very nature of his work requires him to make the acquaintance of every importer of importance in the smaller countries, and with as many as may be practicable in the large.

To recruit such a service it is vital that candidates for training should be intelligent, patriotic and energetic. Beyond question, Canada has many men of the required calibre. The immediate problem is to attract them, and win their interest in this important work. Back of trade development lies the promotion abroad of Canadian interests in general, and in such a splendid and patriotic work the right kind of young men will find an interesting and promising career in the commercial intelligence service.

The period of probation in the office of the director of the commercial intelligence service may last from one to two years. If the candidate answers to this test satisfactorily he is promoted to the post of assistant trade commissioner and attached to the office of a Canadian trade commissioner abroad for further training and experience. If he continues to show capacity and suitabil-

ity he is given a higher appointment as vacancies occur or new offices are established. It will be realized that a trade commissioner can do much to advance the development of export trade, and in that work he will find full opportunity for a career, fair remuneration, a wide experience of men and countries and the consciousness of genuine patriotic service.

The Ability of Such Men

Scepticism is often expressed by business men as to the ability of our trade commissioners to comprehend their particular difficulties of export trade. The question is often asked: "Why do you not appoint business men to these positions?" On the face of it, this appears to be a very reasonable inquiry. There are, however, reasons why a business man is sometimes not the best man for the position. A successful business man does not care to enter the Government service, where the emoluments offered to him are, as a rule, less by far than he can obtain in the commercial world. Therefore, the chances are, that a highly-trained business man who makes application for such a position has been unsuccessful in his own enterprises.

Experience, extending now over a considerable number of years, has convinced the department that a young man trained in the department, conversant, from his examination of correspondence, with the difficulties, the needs and the trend of export trade, is much better qualified, both from the standpoint of the department and of Canadian firms, to fulfill his office abroad. The probability is that a manufacturer of boots and shoes may have a very thorough knowledge of everything relating to the marketing of his own product, but he will have very little or no knowledge of other lines, for example, agricultural implements, hardware, or the thousand and one other commodities which go to make up Canada's export trade. The marketing of these diverse products is constantly studied by the trade commissioners when in training. They have the intelligence to master the complex problems which may be submitted to them, and in time acquire a very thorough and wide-spread knowledge of the conditions pertaining to every feature of export trade.

The dissemination of such information to Canadian manufacturers is conducted through the medium of the "Weekly Bulletin." This corresponds to the official trade publications of other countries, and, once again, all things considered, is comparable to any. It is circulated from Ottawa throughout the Dominion every Monday morning. The circulation is now, roughly, eight thousand copies. It is sent free of charge in Canada to any bona fide applicant. The "Weekly Bulletin" contains regular reports from the trade commissioners abroad, supplemented by special articles in the Department, dealing with tariff changes and customs regulations, proposed steamship sailings from Canadian ports, Canadian trade statistics as issued by the Dominion Bureau of Statistics, statistics of grain movement in Canada; Exhibitions abroad, and other matters of commercial interest.

In addition to the "Weekly Bulletin" is issued a large number of miscellaneous publications outlining the possibility of trade in various countries. All these may be had on application to the commercial intelligence service, without charge. These reports are prepared with the utmost care, and not infrequently high commendations of their

Down at the wharfs, St. John, N. B.

value are received. Such reports are usually the result of special investigations by trade commissioners, and in the past three years, particularly, very valuable information has been circulated, as, for instance, in respect of the trade of the new countries of South Eastern Europe, Egypt, Greece, South China and Spain.

Destructive Criticism

As is to be expected, from time to time criticisms are made of the commercial intelligence service, particularly in respect of the efficiency of the trade commissioners. Most of this criticism is destructive rather than constructive; but the writer is firmly convinced that such criticism is not founded on an adequate knowledge or a just appreciation of their usefulness. Even after many years of experience, the department is often astounded to realize how little is known of the efforts of trade commissioners and their ability to render valuable assistance to exporters. Frequently much trouble might have been obviated if in the first instance the assistance of the commercial intelligence service had been enlisted, and the services of a trade commissioner engaged to consider an inquiry or a negotiation for overseas trade.

The following headings briefly indicate the matters dealt with by trade commissioners:—

The present and future demand for Canadian goods.

Foreign competition.

Specifications of best selling goods.

Reports on foreign buyers.

Recommendations of responsible parties to act as import agents, assistance to such agents by way of introducing them to influential individuals or associations.

Advice as to the best media in which to place advertisements, and the form which such advertisements should take.

The proper display of catalogues, price-lists and samples.

Receiving visitors from Canada and introducing them to possible buyers.

Collecting information as to freight rates, customs tariffs, port dues, etc.

Furnishing details respecting storage arrangements overseas.

Foreign Government regulations which must be complied with.

Terms of credit which can be given to foreign buyers.

Advice as to financial houses and banks which will discount bills or give credits.

Information as to regulations governing the recovery of debts and other legal matters.

Confidential commercial information.

Settling difficulties which arise between Canadian exporters and buyers abroad, as, for example, the disposal of goods abroad contracted for but not accepted.

Infringement of trade marks or patent rights, and advice as to registration, etc., etc.

Consular invoices, documentation and packing.

It will be appreciated, therefore, that the scope of the service which we can render is exceedingly wide, but it should also be borne in mind that unless we are advised of individual difficulties encountered by exporters and kept informed as to the exact type of information which is found by them to be of practical utility, the service must necessarily be of limited value.

The Foreign Tariff division of the commercial intelligence branch was established a year or so ago. There are 189 different and intricate tariffs to be studied, and the constant amendments, preferences, surtaxes, restriction, reclassifications, agreements, treaties, decisions, and the like, can only be accurately interpreted by experts. For many years the department received the publications of the International Customs Tariff Bureau in Brussels, but one who has little occasion to examine foreign tariffs cannot realize the time and effort involved to determine under what group a specific article may fall, and then trace the item through countless treasury decisions to ascertain what the duty is. There are also comparisons to be made as to the treatment accorded to Canada by the various foreign countries as compared with the treatment accorded to her competitors. This division also undertakes to advise on all matters of consular documents, certificates of origin, merchandise marks law, customs regulations, documentation, and invoice requirements for foreign markets.

Until the department succeeded in obtaining the necessary appropriation for establishing the Foreign Tariff division, this portion of its work was badly handicapped. Now, with a well-equipped office, every inquiry in connection with the foreign tariff of any country can be promptly dealt with.

In the consideration of export trade there is one word which the writer desires to impress with all possible em-

phasis—that word is "thoroughness." This idea should not be regarded as too commonplace or as the criticism of an arm-chair critic, but after many years' service in the department he is convinced that in the observance of this quality lies the key to success in business abroad. Want of thoroughness has been the cause of countless complaints received in the department of trade and commerce for many years. The writer does not wish to stress the point in general condemnation of Canadian methods, but thinks it is a complaint which is heard too often. Goods must be up to the quality to the last degree, and not only that, but if a reputation is to be maintained abroad, especially in Asiatic countries, (though the same applies very largely in Africa, and South America) such details as the identical colour and marks on the label must be consistently retained.

For example, a Chinaman takes a fancy to goods put up in a certain label. The goods are sold "on the label." If he likes them, a competitor cannot beguile him from his fancy. Better goods

Market slips at St. John, N. B.

might be put up, but if the label be changed in the slightest respect he will refuse them. This may seem absurd from a Canadian point of view, but it must not be forgotten that the foreigner has his peculiar point of view, his prejudices and his idiosyncrasies. The man who has goods to sell is the man who has to meet these peculiarities. The buyer is entrenched in his position; he is not forced to buy any special line of goods, hence exporters must meet him all the way if they want him as a customer. You cannot send him what you think is just as good as that which he knows he wants.

A shipment of clocks at one time was ordered for South Africa. The exporter had a slightly better line of clocks which

Another view of the market slip at St. John, N. B.

he shipped instead, and after the shipment had been carried on the backs of negroes, and by oxen transported into the back country, the shipment was refused and loss sustained. A few months later it was ascertained that the reason for the refusal was that the clocks had not a loud tick. The Kaffir had ordered the clock shown him, which happened to have a loud tick. He has his vanities like the rest of us. The Kaffir places his clock on the table and leaves his front door open so that his neighbor in passing can hear the clock tick. He wants his neighbours to know that he is able to possess a clock.

Exporters must, therefore, ship the identical thing ordered, and should nail this motto to the mast: "Thoroughness in quality, thoroughness in packing, thoroughness in everything connected with the shipping documents."

The department desires to encourage communications from exporters, and to aid them in their difficulties. It asks for their co-operation, their support, and their criticisms. It is hoped that the latter will be accompanied by constructive suggestions. It is further pointed out to exporters that, while the department of Trade and Commerce expects to render service to the whole country, the Commercial Intelligence Branch is particularly adapted to their needs, and aims at helping them in introducing Canadian products to every market in the world.

Canada has a government merchant marine consisting of a fleet of 63 steel ships ranging in tonnage from 2,800 to 10,500 dead weight. Of this number 54 were in commission this last season and the balance under construction. All contracts have been let in Canada at a cost of $73,000,000. These vessels are now found on all the principal trade routes of the world.

ELECTRIC RAILWAY BOOM IN GREAT BRITAIN

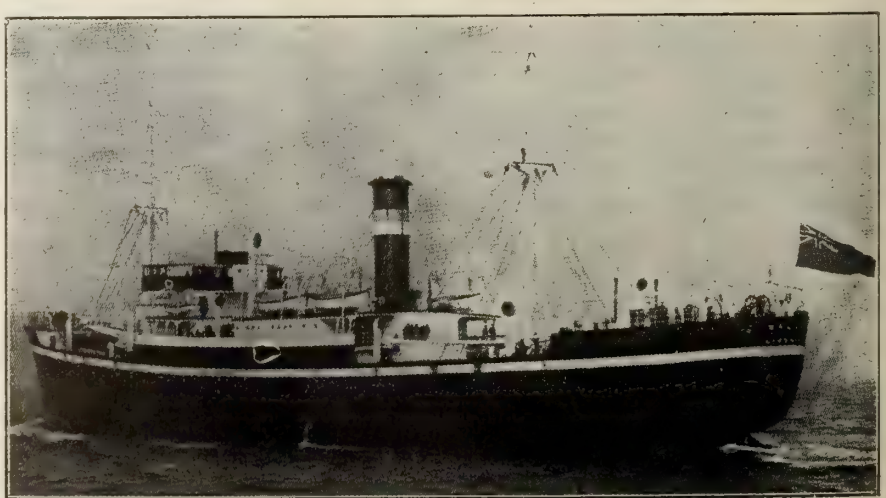
Remarkable activity is being shown by British railways in connection with the conversion of lines, especially in the neighbourhood of London, from steam to electric traction. The Great Eastern Railway Company, which carries an enormous volume of traffic from the city to the east and north east of London, has prepared a scheme of electrifications and other improvements which will involve a capital of about £10,000,000. The London Brighton and South Coast Rly. is bent upon electrifying practically the whole of its system between London and Brighton and the "Underground" group in London has prepared a scheme for spending £6,000,000 on the development of its tube railways and allied transport services. The South Eastern and Chatham Rly. has also made several plans for the conversion of its suburban system. One of the methods of propulsion laid before this country by a British engineering firm has some highly novel characteristics. It is proposed to propel the trains by means of internal combustion locomotives generating electricity, which in turn drives the motors on the locomotive or other parts of the train. The system is equipped with the usual overhead line or third rail which in this case, however, acts merely as a power interchange line. When a train is running down hill it returns current to the line; and when it is standing at a station the engine continues to run and to pump current into the interchange line. In this way additional power is afforded to trains which are ascending gradients or starting at stations. It is claimed that this system saves a large amount of capital expenditure and is very economical, especially where traffic is not dense enough to justify the construction of large power stations and transmission mains.

Two hundred and fifty million acres of tillable land in Canada await the tractor and the man.

There is a steady, though not now large volume of immigration pouring into Canada. The total for the year ending March 1921 was 148,477 an increase of 26 per cent. over 1919-20. Of this number 74,262 came from the United Kingdom and 48,059 from the U. S. A.

Looking Over the *Shipping* Situation

By T. H. FENNER, Editor Marine Engineering of Canada



ONE year ago the writer opened a similar article by saying that shipping in general was in the doldrums, and sad to relate it has remained in the same desolate trade region during the intervening period. Shipowners and shipbuilders, like the old sailing ship men who were becalmed, are still whistling for a wind that will fill their sails, and carry them into the path of the full trade winds, but there are few signs of such a desirable breeze approaching. There have been zephyrs and ripples on the surface of the calm sea, but they have proved to be the lightest puffs, which died down before they had imparted any way to the vessel. Hope, which springs eternal in the human breast, is fortunately still lending its spreading wings to the minds of those becalmed, and giving them the necessary encouragement to face the situation with fortitude. The writer shares the hope that if he is called on to write on shipping one year hence, his introductory words will not be so lugubrious.

From the beginning of 1921 the returns of ships under construction have shown a steady falling off in point of tonnage, and even the tonnage shown in the tables was misleading, as a large amount of it was under suspension. That is, after a certain stage of completion had been reached, further work was stopped. A large number of contracts were cancelled, large sums being paid in default, owners feeling that it was better to take a known loss than to continue building ships at high capital cost when the freight market was rapidly falling.

Added to this the strike of the ship joiners in the British yards held up an enormous amount of tonnage, and made a bad situation worse. In this general period of depression, the liner companies kept steadily on at their building programmes, made necessary by the losses sustained by their fleets during the war. The class of vessel that was chiefly affected was the tramp or general cargo boat of medium tonnage. This of course was perfectly natural, as these vessels usually run on a small margin, and high capital costs would be fatal to their chances of paying a dividend to their owners. The fleets that were being built for the United States and Canadian Governments were of course continued with, the fact of being able to pay for themselves or otherwise, not being a consideration when the whole country had to pay for them. These fleets are now about completed, and shipbuilding in both Canada and the States has arrived back at the position it held before the war blew it up to such inflated dimensions.

State of Shipping Trade

There is no better barometer of the state of the shipping trade than price of ships in the open market. A couple of years ago anything that could float commanded a purchase price of from $175 to $200 per ton, and even on such a large capital expenditure, could still pay high operating costs and make a good profit. To-day, vessels that actually changed hands for prices such as mentioned above, are being sold, where a buyer can be found who has a special use for them, for the sum of $30 to $35 a ton. Probably no other line of merchandise or manufactured goods can show a drop approaching this, in values. Further, there are almost no buyers even at this low price unless it is, as before mentioned, for a ship to put on some special route or for a special purpose. This drop in value means to the people of Canada that the fleet they

The motor ship "Malia" fitted with opposed piston two cycle Diesel engines of the Fullagar type.

have invested some $70,000,000 in, is at present values only worth about $10,000,000 or would be if it was still all afloat. The vessels lost will of course be replaced in value by the insurance carried, that is the amount necessary to repurchase a ship of the same size at the prevailing prices would be paid to the owner, in cases where a total loss was incurred.

Whatever the amount received for the vessels lost, it will have little effect on the general value of the whole fleet, which is not influenced by whether the ships are privately or publicly owned, what flag they are under, or any factor at all except their value in the open market. For the next few years competition in the ocean transportation business is going to be of the keenest, and it will be a question of "sauve qui peut." There are many thoughtful men who think it would be a good plan to cut the losses, and dispose of the Canadian Government fleet at the most advantageous terms to be obtained, rather than continue operations at great loss to the country. There are others, and notably in the inland provinces, who feel that anything owned by a Government, or rather publicly owned, is possessed of certain inherent virtues, which make it worth while whatever losses it involves its owners in.

All the maritime nations have increased their shipping since the armistice, and it is interesting to note that the Germans are once more coming into the scene as active competitors on the sea lanes of the world. They have been conducting a joint service between Germany and the U. S. with the Harriman lines, using American ships. Quite recently an old arrangement existing before the war between British and German lines trading in the far East has been renewed, and the Germans will be able to man their part of this joint service with their own ships.

The Latest Figures

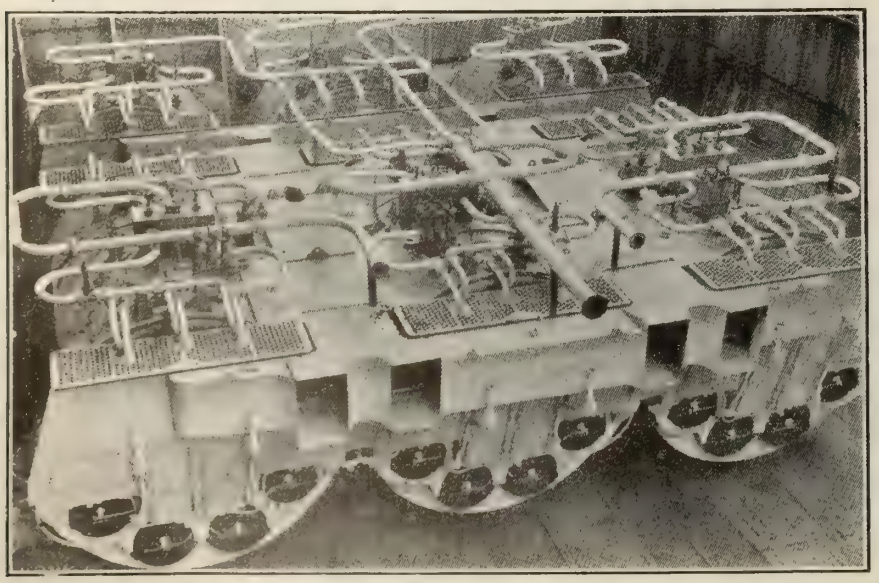
The latest returns of Lloyd's Register of Shipping tell the story of the decline in shipbuilding better than any other single factor. In December 1920 the total tonnage under construction in the world was, (excluding all vessels under 100 tons and war vessels), 7,179,779 tons, which was divided up between 1,640 steamers, 189 motor vessels, and 151 sailing vessels. The United States at that time had under construction 1,310,312 tons, of which 1,278,020 were steel steamers, the rest being motor vessels and sailing vessels both wood and steel. In Canada there were under construction 127,862 tons of steel steamers, and a number of wooden and steel sailing and motor vessels that brought the total up to 136,759 tons. The total tonnage under construction in the United Kingdom was 3,708,916 tons gross, while the total tonnage building outside of the U. K. was 3,470,862 tons.

The latest figures available, which are those for the quarter ending September 30th, 1921, show a falling off in figures, but the actual falling off is greater than the figures show. This is on account of the large amount of tonnage on which construction has been suspended. The total tonnage under construction in the United Kingdom at the date above mentioned, was 3,282,972 tons, while the total for the whole world was 5,542,978 tons. These figures, of course, in both cases exclude Germany, the latter not being available, but would have little influence on the general total. This shows a falling off of 1,636,821 tons, but when the figures for tonnage under suspension are considered the loss is much greater. There is in Great Britain a total of 1,188,000 tons, on which work has either been suspended or completion postponed, while abroad there is a total of 375,000 tons suspended. This materially reduces the figures which may be considered to represent work actually under construction, bringing it down to 3,979,978 tons. The tonnage under construction in the United States is at the date under consideration only 433,962 tons, which is composed of 403,362 tons of steel steamers, the rest being divided between steel and wooden motor and sailing vessels.

Canada had under construction only 67,255 tons steel steamers, and before the December quarter is reached, most of these will have been completed. It is interesting to note that outside of the United Kingdom and United States, the principal countries engaged in building ships are Italy, France, Holland, and Japan. Japan has the least tonnage of the four named, about 190,000 tons, while each of the others have just a little under 400,000 tons under construction. There are a large number of vessels of the special class built for carrying oil in bulk under construction, 81 of which are being built in Great Britain, and 23 in the United States. There are over 400,000 tons building which are to be fitted with internal combustion engines. The tonnage building in the United Kingdom is 59.2 per cent. of the total, which is getting back to where it used to be. However, the proportion of work completed to work commenced is very low, and it is this feature, combined with the absence of any new orders, that makes the outlook so bad.

Labor Troubles

Great Britain has suffered more from labor troubles in the shipbuilding trade than any other country during the past year, and the stubborn attitude adopted by the men has resulted in the loss of millions of pounds' worth of work. To make it all the more annoying, some of



A typical British cargo liner.

this work has actually gone to our recent enemies, while in other cases the cost of ships has gone up very considerably from the first estimates. One of the worst strikes has been the ship joiners. These men went out on strike as a result of a proposed reduction in wages to allow the builders to compete. The cut was accepted by the other trades concerned, but the joiners refused to consider it. There happened to be a lot of work in the house-building trade and the joiners were readily absorbed in that. Not so the rest of the trades, who were thrown out of work by the action of the former. Many ships that were to be repaired and reconditioned were sent to Rotterdam, Antwerp, and even Hamburg because their owners needed them and could not take a chance on the delay in getting them into service again that would result from the dilatory tactics of the labor unions.

Many vexatious restrictions were stubbornly adhered to by the men in different trades, and thousands of men were walking about drawing unemployment doles as a result. One instance in point was the case of the boilermakers in the Liverpool district, and their objection to the use of the oxy-acetylene torch for cutting plates. They did not object to the torch, but demanded that when it was used the same number of men should be employed to do the cutting as when it was done by hand, and those men not handling the torch should stand by while the work was being done and draw pay for it. They hung out for a long while on this untenable position, but have finally capitulated. The joiners' strike has at last been settled, but things have come to such a pass that it will be a long time before there will be employment for them and their fellow workmen. The prime necessity in Great Britain is cheap coal, and until coal comes down to a price where steel makers can compete with other countries, there will be more or less stagnation in the shipbuilding and allied industries. There is one good sign, and that is the increase in production of coal, and the fact that Welsh coal is once more being shipped to the foreign markets where it once reigned supreme.

During the coal strike in England and Wales, American coal found its way into European markets, and even South African and Australian coal was shipped to the same quarter, but naturally, this could not be expected to continue. The American coal dealers, assisted by the U. S. Shipping Board, tried very hard to establish a firm footing, but with coal being produced at anything like the same price in England and Wales, it is an impossibility for them to compete. The French Government after hanging fire for as long as possible in order to benefit by any further reduction in price, has at last given orders for their supply of Welsh coal for the railways. Other European buyers who had fairly large stocks on hand are making enquiries. The miners seem to have made up their minds to work and in this is the most hopeful sign in the whole industrial outlook. As the writer has pointed out before, cheap British coal is a stimulus to the whole industrial world of Europe.

When European buyers can get this vital necessity at a price that makes it possible for them to run their factories at a reasonable cost, they have goods to interchange with each other, and Britain has cargo for her ships, and cheap raw materials for her factories. She has also cheap coal for her blast furnaces and her shipbuilding and engineering industries, so that she in turn can export manufactured articles in exchange for food stuffs, raw cotton, jute, fertilizers, ivory, rubber and the thousand and one things needed by a population of forty millions odd in a highly civilised country. One of the important trades is the ore trade from the coast of Spain, in exchange for coal from the coast of Engand, and this market has shown some improvement. The situation was admirably summed up recently by no less a person than Lloyd George in this way, "It is not summer, it is not even spring, but the extreme rigor of winter is passing." That description might be fittingly applied to the industrial situation in Canada, as apart from the shipping situation itself.

The boilers and steam pipe layout of the new Cunard liner "Laconia."

Canadian Shipping and Shipbuilding

Canada has always had a certain amount of shipping flying her own flag, and, as is well known, had at one time a very considerable wooden shipbuilding industry. This, of course, like the wooden ship industry in the U. S. was wiped out when Great Britain started building iron steamers, and captured the lion's share of the shipbuilding trade of the world. Although Canada has on her eastern coast very fine deposits of coal and iron, there does not seem to have been any effort made to establish a shipbuilding industry in the logical place for it till recent times. Of course, the earlier Canadians were more occupied in railway building, and agriculture, and the maritime provinces were more or less neglected for a long time. The higher cost of labor in Canada also militated against it. Whatever the causes, shipbuilding in Canada languished, with the exception of two or three yards on the Great Lakes, and one on the B. C. coast, till the war came along with its demand for ships, ships, and more ships. Then it was that shipyards sprang into existence overnight, almost. The first stimulus was given by the Imperial Munition Board, which carried out a program of building that amounted to about $70,000,000, and this was followed by the Canadian Government program of 63 ships, costing about the same or a little more. In addition to these two programs, a few ships were built to foreign order. A number of shipbuilding yards were started by contractors and others totally unused to shipbuilding, and when the rush subsided these yards naturally were the first to subside also.

The shipyards mentioned in the official report of the Department of Marine and Fisheries for the year 1915-16 covered just six firms. Of course there were really more than that, as there are always a number of little yards building schooners, etc., down on the N. S. and out on the B. C. coast but these six yards were the only ones that could really be designated as shipbuilding yards. In the following year's report there are ten yards more deemed of sufficient importance to be mentioned specifically. There were several fairly large yards which for some reason did not seem worth mentioning in the Government reports, but at the height of the boom, there were about twenty yards engaged in the building of steel and wooden ocean-going steam tonnage. This takes no account of the schooner builders of the Maritime Provinces, of whom there were literally hundreds. The Government were much impressed by the apparent permanence of this shipbuilding industry, and accordingly made arrangements to subsidize the Dominion Steel Corporation at Sydney in the erection of a plate mill which could roll plates and shapes for ships, eliminating

the need of importing these very necessary components of steel ships. They even made a contract with the company to take a large quantity of plate per annum over a period of five years from the completion of the mill, the contract being placed at the then high rates. Everyone in Canada seemed to approve of the Government's action at that time as being the best thing possible for the country, but in the light of events that have since happened, they are expressing doubts. Some of them are even saying that they knew all along that it was a mistake.

The writer has always held the opinion that there is room for a certain amount of shipbuilding in Canada, and that a steel company situated right on top of all its own material, as the Dominion Steel Corporation is, should be able to produce as cheaply as anyone in the world. There is no reason why in normal times the mill could not get some of the foreign orders that are going, and probably in time the action of the then Government will be justified, as far as the plate mill is concerned. As regards the shipbuilding industry, the Minister of Marine, through the departmental report, made mention of the fact that the Government's shipbuilding contracts would carry on until 1920, by which time the industry would be on a firm footing. As it happened, further contracts were let which carried on the work until 1921, but without the desired effect of putting the industry on a firm footing. As far as many of the yards were concerned there was no chance of them ever being on a firm footing, and it was just as well that they should disappear in the ordinary way of commerce.

There are, however, several husky survivors in existence to-day, whose foundations are firm, and who will tide over the intervening time in safety, and be ready to carry on when business resumes its normal activity. The writer has never had any fear for yards that are situated on tidewater, and have graving dock facilities as well as shipbuilding facilities. The same applies to the old established lake yards, which are well provided with repairing facilities. These yards can generally be depended on to carry on a profitable career even if they never built a ship. Yards on the other hand, that were erected purely and simply to build, and equipped with machinery purchased at war prices, and often built on land that cost war prices to acquire, had but little chance of living under ordinary competition. When it is further considered that the guiding hands in many cases were utterly unfamiliar with shipbuilding, it was but natural that they should fade from sight. The shipbuilding boom is over for Canada, leaving in its trail practically all the yards that were here before it arrived, and having ended the careers of most of the new ones.

When it comes to the ships themselves a different case is shown. Canada is, in this case, still in possession of all the ships that she built to create a merchant marine, with the exception of those that have been lost by perils of the sea. These include the "Canadian Recruit," which was unfortunate from her early days, and "Canadian Exporter," which are total losses, while the "Canadian Importer" will be repaired.

In the report of the Department of Marine for the year ending March 1916, it is stated that it had formerly been the habit to value ships on the Canadian Register at $30 per ton, but owing to abnormal conditions, this price was much lower than the actual price prevailing which was from $75 to $100 per ton. It also stated in this report that there had been much agitation for the creation of a purely Canadian Mercantile Marine, and that in this connection, it should be borne in mind that the day of the small carrier had gone. The most efficient vessel was one between 7,000 and 10,000 tons deadweight. This is interesting to note in view of the class of ship that was actually built for Canadian merchant marine, at a cost of practically $200 per ton.

Of the total number built there are no less than thirty-one which are under 5,000 tons, while there are nineteen of these under 4,000 tons, and three of them under 3,000 tons. There are but two ships of 10,000 tons or over and twenty-one of 8,000 tons or over. The value of all these ships in the open market is now about what it was before the war, that is about $30 per ton. Of the vessels building in the United Kingdom at the present time there are out of a total of 633, no less than 366 over 4,000 tons deadweight, and the remainder include a number of small craft for strictly local trades and coasting vessels. For ocean-going traffic, a vessel of under 7,000 tons deadweight capacity is not a good proposition, the reason being, of course, that operating costs are out of proportion with the larger vessels.

Engineering Development

The development in the marine engineering world has been, as it has for some time past, along the line of motor-driven vessels, coupled with a further application of the geared turbine. One vessel was built in the United Kingdom with electric drive, but this vessel was for an American shipping concern. The electric drive has not found favor with the British shipowner, although it is being adopted in the U. S. both in naval and merchant fleet construction. A discovery that is expected to considerably widen the knowledge of propelling problems is a method of getting the actual thrust developed by the propeller at the thrust block of the ship, something that has not hitherto been available. The method is by using a number of cylinders, grouped round the Michell thrust block, which receive the thrust in of the propeller on diaphragms, which transmit the pressure through oil pipes to gauges, on which the actual thrust in lbs. per sq. inch is registered. Much more accurate knowledge of propeller performance can be obtained in this way, and improvements in design will follow. Opposed piston two cycle Diesel engines have been developed further, and in one particular case which marks a radical departure, it has been tried out in a coasting steamer, and has now been fitted in an ocean-going steamer, an illustration of which is given here. There have been several large liners converted to the use of oil fuel during the year, including the "Aquitania" the "Mauretania" the "Olympic" and the "Empress of Britain". Another development in engineering which has been applied so far to only small coasting steamers, fishing boats, etc. is the Kitchen rudder, an apparatus which enables a steamer or motor boat to perform all the maneuvers of going ahead or astern, at any speed desirable, at the same time steering in any direction while the engines maintain a constant speed. This is especially useful in the case of small craft, such as tugs and fishing boats, as all the manoeuvering can be done by

Dry dock of the Halifax Shipyards.

the navigating officer, without the interposition of the engineer. The makers have gone slowly, and are gradually applying the apparatus to vessels of larger size, and it is quite within the bounds of possibility that it may eventually be applied to the largest. The more extensive use of oil for fuel and for internal combustion engines has led of course to a larger demand for oil tankers, and there are a large number of these vessels being built. The latest returns of Lloyds give a total of 140 of these tankers as being under construction throughout the world, of which 81 are being built in Great Britain and Ireland.

The U.S. Shipping Board Fleet

The past year has been a disastrous one for the great fleet of our neighbors to the south, and has witnessed considerable upheaval in the shipping board control. Following the general charges of graft and incompetence that were made against the original shipping board, a new board was appointed, with a new chairman, Mr. A. D. Lasker who was at the head of a large advertising agency but not by any means a shipping man. The rest of the board were just as inexperienced as the chairman in shipping matters, but before they had been very long in office they called to their aid three well known shipping men in the U.S. to assist them in the management of the national white elephant. The fleet during the year has been losing money at the rate of $300,000,000 per annum, but now that the wooden ships have all been got rid of, for the price of about one of them, the losses will be cut to some degree. These wooden vessels were costing no less than $135,000 per month to keep in idleness, so that getting rid of them at any price was a good move. A leading American shipping paper came out boldly with the suggestion that the whole fleet, wooden and steel as well, be taken to sea and sunk as the easiest way out of the mess, but naturally so drastic a course was not looked on with favor. One of the latest methods of trying to get the ships into use has been to offer them to private owners at a charter rate of $1 per ship per month, the board to carry all insurance charges. So far there has not been time to see how many private owners want them at that rate. The trouble with the U.S. fleet of course is that they cost more to operate than any vessels afloat, and furthermore there is ample evidence from reliable sources, that the operation as well as the management has been woefully inefficient. The United States is not a maritime nation any more than Canada is, and any artificial attempts to make it so are liable to be a failure. As Sir Joseph Noble, a well known shipowner, said recently, the growth of the British merchant fleet has been a slow one, extending over 200 years, and a result of the initiative and courage of traders, shipbuilders, shipowners and engineers. He further says, "These facts should give us confidence when we are inclined to fear the competition of friendly rivals who are actuated by sentiment more than actual need." This phrase surely applies to the United States, and in a lesser degree perhaps may be applied to Canada, who could hardly be conceived to have an overpowering need for a merchant navy.

The Shipping Board has on one or two occasions during the past year attempted to get cargoes for ships by shaking the big stick of the Jones Act, which ill-considered piece of legislation has never been put into force. One of these cases was the Egyptian cotton incident, when the Shipping Board demanded that all cotton cargoes from Egypt to the U. S. should be given to their steamers. They actually quoted much lower freight rates than the lines in the British conference, but the shippers had such little confidence in their ability to handle the cargoes successfully, that they refused to give them any cargo. The Shipping Board agent and the American consul then resorted to threats of discrimination against cotton coming into the U.S. by British ships, and there was almost an international incident over it, until their over-enthusiastic officials were called off by their Government in Washington.

The General Outlook

The outlook for the shipping fleets of the world is at present not very bright, as the world-wide depression naturally affects ships about as quickly and as severely as it does any other interests. The exchange rate, which militates so largely against international trade, prevents the ships having full cargoes to carry. The increase in the world shipping totals is not such a serious factor as some would have us believe, for while there has undoubtedly been a large increase, a great deal of the tonnage comprising it is of ancient vintage, and not suitable for modern use. With a revival of trade a good deal of this shipping would be removed from the register, and replaced by more modern tonnage. The liner fleets are busy bringing their fleets up to pre-war efficiency, one of the most notable being the Cunard, which has something like a dozen of the most up-to-date type of liner under construction, the first of which, the "Scythia," has been placed in commission. These sels are of the intermediate type, that is they combine large carrying capacity with a good amount of passenger accommodation and a reasonable speed. The liner de luxe is not being built. Tramp shipping, which plays such an important part in the well-being of Great Britain, is largely tied up, but as mentioned before the revival of demand for Welsh coal by foreign buyers, will give a welcome stimulus to this class of vessel. Exportation of coal will also help to bring the pound sterling back to normal again, and revenues from outward and homeward freights will be swelled. In this connection, it was estimated by a very high authority that the value of the invisible exports, which is how freight revenues are described, before the war, was £100,000,000. This is what the British mercantile marine earned without the values of the cargoes that they carried out with them, and the raw materials they brought back with them.

It is a rash man who would make any prognostication of the trend of future events, in the light of the performances of the past couple of years. As far as Great Britain is concerned, she is bringing her fleet up to efficiency as fast as she can, beset with labor troubles and general depression as she is, and will no doubt be found when the revival comes with at least her fair share of the world's carrying trade. Other countries, notably France, Italy, Holland and Japan, have increased their merchant fleets considerably but Japan, at least, has suffered some heavy losses with the decline of the freight market. The United States have a fleet on their hands which has cost billions of dollars, and the prospect of it ever being an asset to them is doubtful. Canada has also got a fleet on her hands, and how much the past year's operations have cost us we do not yet know. It has the benefit we believe of competent management, but in view of its high capital cost, and that it can only obtain the prevailing freight rates, it is doubtful if it can be expected to carry on without heavy losses. It has to compete in the world market. It has, like other properties owned by the people, the constant danger of being experimented with by any new set of politicians who happen to get elected, and in view of this the taxpayer cannot view his ownership of a fleet with anything like equanimity. He still has the privilege of hoping. As Mr. Ballantyne sorrowfully confessed, "the Canadian manufacturer does not seem to be availing himself of the opportunities to create new export markets which the fleet affords." There is little chance of any route being neglected by private owners where there is any hope of a return, and it is very doubtful if the C.G.M.M. will have much success in its efforts towards creating new trade fields.

It has been seriously mooted by a member of the Shipbuilders and Engineers in Scotland that in the coming few years it will be impossible for any vessel driven by power alone to make a living, and he has suggested that the solution is the motor-engined clipper schooner. He proves his case by means of curves taken over a period of a couple of thousand years. Other authorities insist that the worst is over, and several large British shipowners say it is entirely a matter of labor settling down to work in order to bring prosperity back. There are various theories The simple fact seems to be that we are slowly recovering from a time of abnormal conditions, and the period of adjustment is longer than it was expected to be. Probably a good deal of the trouble is due to artificial restraints of trade in the form of high tariffs that have been introduced in countries where formerly there was free trade, such as has happened in the newly created states of Europe. The Fordney Bill in the U

Expansion of Mineral Industry In Ontario

Ontario Occupies Premier Place in Production of Minerals—Gold—Silver—Nickel and Copper Are Chief Metals—Brief Review of Present Situation and Outlook

By THOMAS W. GIBSON
Deputy Minister of Mines for Ontario

THE MINERAL industry of Ontario has been steadily expanding for a number of years. It may not be generally realized that the Province of Ontario occupies the premier place in the Confederation as regards the production of minerals. For instance, in 1920 out of a Dominion production valued at $217,775,080, Ontario's output was $78,749,178, or over 36 per cent. of the whole; and twice that of any other Province; and this, too, notwithstanding the absence of coal, which bulks largely in the production of Alberta, British Columbia and Nova Scotia.

The metals of chief production in Ontario are gold, silver, nickel and copper. The effect of the war was to stimulate the production of nickel and copper, which are pre-eminently required for military purposes. On gold mining, the war had a depressing effect, due to increased cost of production and inefficiency of labor. These causes also adversely affected silver, but on the other hand, owing to the stoppage of shipping, silver was required to balance exchanges in the East, and in consequence the price of the metal was greatly increased. A brief review of the present situation and outlook may be timely, taking the metals separately.

Nickel and Copper

Both metals have their source in the ores of Sudbury. During the war these mines were worked to their maximum capacity. Levels and stopes were crowded with men; new furnaces were built, and refining facilities greatly increased. The sudden stoppage of the war in November 1918, found an accumulation of nickel in the hands of the mining companies, the Allied Governments, and their contractors. Like conditions obtained in copper. The process of reconstruction has been disappointingly slow, and these large stocks have not yet been absorbed. One large battleship will require 400 tons of nickel in its clothing of armour plate, which is more than enough to supply many thousands of automobiles. If the Disarmament Conference results in the cessation of battleship building, the world will rejoice, but it will be hard on the nickel industry. However, the use of nickel in strengthening and hardening steel and for other industrial purposes, is so well established, that with the return of manufacturing generally to anything like normal conditions, nickel will come back into its own. Monel metal will be pushed, and also the use of nickel for coinage, alloys, electro-plating, table and kitchen utensils, etc.

There are three nickel-copper companies at Sudbury. The International Nickel Co., the Mond Nickel Co. and the British America Nickel Corporation. All three are at present closed down, or nearly so. The production of nickel in 1921 will be less than it has been for many years, and the prospects for an early resumption are at present not too bright.

Silver Production

The Cobalt mines are the chief source of the silver production in Ontario. Cobalt has indeed been a wonderful camp. Since the discovery of silver in 1903, there has been produced about 325,000,000 fine ozs. of silver, valued at $200,000,000. The peak of production was reached in 1911 at 31,000,000 ozs. Since that time the output has been declining, but the higher prices for silver have pretty well maintained the value of the annual production. High-grade ore, abundant in the early years of the camp has become scarce, and the production now comes from low-grade rock. The life of the camp is being prolonged by the lowered costs of mining, improvement in metallurgical methods—notably the "flotation" process—and by the finding of new deposits in old properties. An instance of the last-mentioned feature is afforded by the Keeley mine in South Lorrain. This mine was deemed exhausted years ago, but is again producing at the rate of 100,000 ozs. per month. The total quantity of silver produced at Cobalt in 1920 was 11,000,000 ozs. worth $11,000,000. In 1921 the yield will be about the same, but the value will be less owing to the fall in the price of silver.

Gold Has Benefited

Unlike the other metals, gold has benefited greatly by the conditions which have prevailed since the war. Prices of supplies have gone down, and while there has not been much actual reduction in the daily rate of wages, labor is back to pre-war efficiency. Gold is its own market at a fixed price, and when sold is paid for in U. S. funds or their equivalent. The result of these favorable features has been to give a great impetus to gold mining in Northern Ontario, where, at the present time, the prospects for the industry are equal to those in any other part of the world. The output in 1920 was $11,665,000. In 1921 it will be about $15,000,000, and from present appearances, in 1922 it may reach $18,000,000 or $20,000,000. Ontario has outstripped in gold mining every state of the Union except California, and the figures for this year will probably show that even California has been left behind. A significant feature is the number of widely-separated localities in which important discoveries of gold have been made, thus increasing the chances for an extensive and permanent industry.

The main producing camps are Porcupine and Kirkland Lake. At Porcupine the leading mines are Hollinger Consolidated, McIntyre-Porcupine and Dome. The first named is one of the great gold mines of the world. Its output in 1920 was a little over six million dollars. This year it will be between eight and nine million dollars. Last year McIntyre yielded $2,200,000 and Dome a little over $2,000,000. Both these mines will show increased production for 1921, and all three contemplate increasing their crushing capacity provided additional electrical power can be obtained. At Kirkland Lake gold bullion in 1920 had a value of over $1,000,000 from three producing

Following the Trend of Machine Tool Design

Forty Years of Development Recorded—It is Surprising How Many Types Were in Use Even in 1881—Many Changes Have Taken Place — Modern Machines Are Marvels of Accuracy

By J. H. Moore

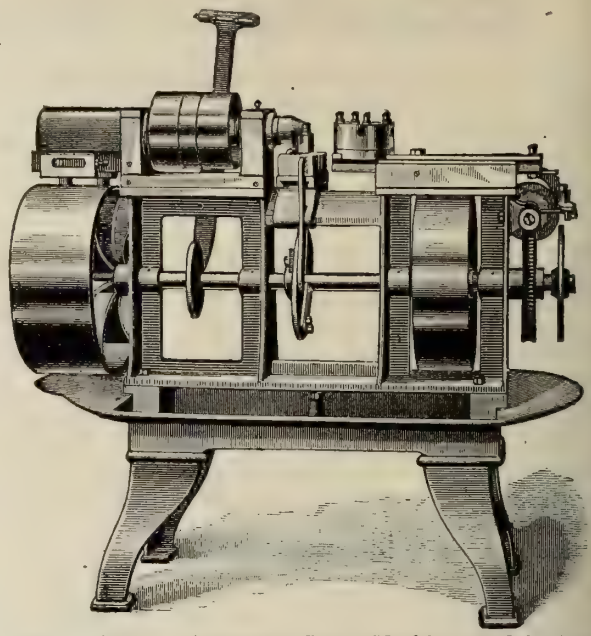

Fig. 14—Spencer Automatic Screw Machine used in 1897.

TO FOLLOW the trend of machine tool design is both interesting and instructive. It is like walking through a museum, where in retrospective manner, you can view the fashions and customs of those earler times. Comparing agricultural implements with those of today, we find that marvelous developments have taken place. What can be said of agricultural machinery is equally true regarding all kinds of machine tools, both metal and woodworking.

To go back to that period when any power other than hand, foot or mule, was unknown would serve no special purpose, so that on entering this subject of machine tool design and its trend, we will decide to begin at the year 1881, or exactly forty years ago. To cover both metal and woodworking tools would occupy quite an amount of space, so we will consider the metal-working tools only.

Reading from a catalogue dated 1881, we find the following, "The description of tools enclosed in this book are made from new and carefully studied designs, and are intended to meet the present demands of the trade, viz., "strong, accurate and durable machines," etc., etc. Evidently the English language was handled in about the same manner in 1881 as at the present time, for further on in the catalogue they speak of the importance of productive methods.

We could easily take the exact wording, insert it into any modern catalogue and it would read as if it were meant to be there. Therefore the method of description has not changed much, but how about the machines?

There is a slogan which runs, "The Picture Tells the Story," and as this statement is a very true one, we will largely depend on the message which the earlier models of machines present to the reader. We will merely comment briefly on each one, as to go into a lengthy description would occupy too much space. Take for example Fig. 1. Here we see a No. 7 plain milling machine. It will be noted that it is of the Lincoln type, and on viewing it closely we see that the head is cast solid with the bed. The description at that time says that it is heavily braced, not only above, but below the top of bed, and that the spindle is so mounted that it secures an exactness hardly possible in the old style machine. We would like to show the earlier model, but will adhere to the decision to start from 1881, the machine shown being used at that time. It had four changes of feed, also a postive automatic knockout.

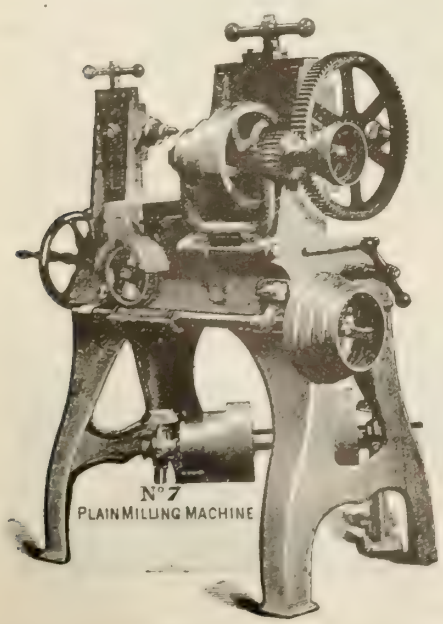

Fig. 1—Plain Milling Machine used in 1883.

Drill Press Design

At Fig. 2 we see a 22 in. upright drill press, and in this type of machine, designers seem to have hit pretty well on the present adopted idea. Of course the spindle construction was very poor in comparison with the modern type, and the method of supporting the back pulleys was rather peculiar. Proportions and general lines have also changed for the better, useless fancy design in casting work having been eliminated. We have records to show that in 1883 drill presses were equipped with back gearing, power feed, quick return, etc. Gear guards were considered unnecessary, and this fact is true on practically

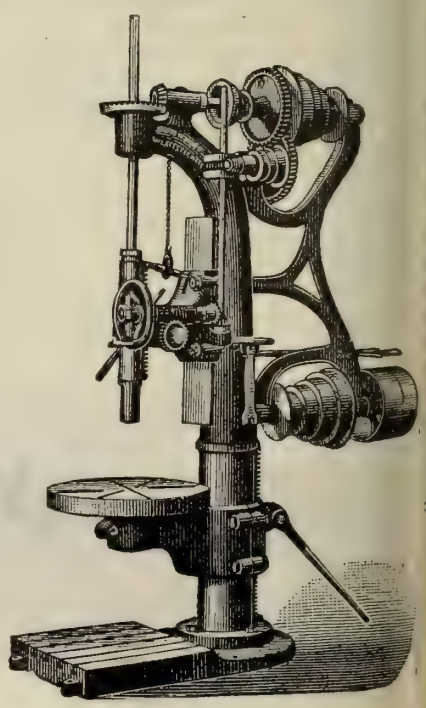

Fig. 2—Upright Drill used in 1883.

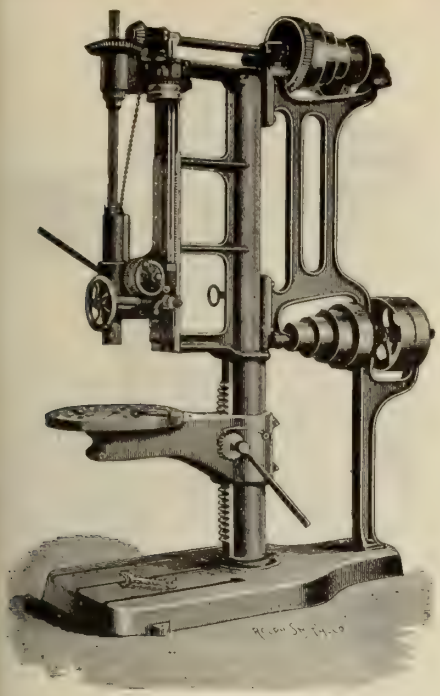

Fig. 3—Drill press used in 1886.

all the earlier models. When guards were attempted, they were usually made of sheet iron, being very clumsy and awkward to remove.

Ideas in drill press design seem to have differed around this period, for the machine shown at Fig. 3 was used in 1886. In speaking of this drill press, the makers say that it bores to centers of 4 feet, and that its weight is 3,040 lbs. This, to say the least, is a peculiar way to put it.

Radial drills were also in use at this time, although their design was quite different from the 1921 model. The table on the earlier type stretched the complete length of the radial arm, and usually, about thirty-two Tee slots were cut in this table, ten on each side, and twelve on the top. Of course this varied according to size. The lines were not appealing to the eye, but as the machines were of rugged design, they completed their work very satisfactorily, which was the main consideration.

Planers in 1886 were nothing to boast about, yet the fundamental principle was there. Compare Fig. 4 with the modern planer, then form your own conclusions. Designers had an eye for beauty (?) in those days and went in for fancy curves. No doubt the pattern maker and molder had different views on the matter, but such was the trend of the times. The writer remembers a very old planer that had some wonderful decorative designs cast on both the uprights and the bed. Beautiful (?) eagles perched on the machine at different points, but perhaps the makers were trying, in a sly way, to tell people it was a bird of a machine.

Looking at Fig. 4 we find that great developments have taken place since that time. Compare the present reversing mechanism with that shown. Power feed for raising the rail has also been added and at the time the machine shown was built, the feed gear was worked from a small friction plate. Note also how the bed V's came in at the end of the bed. The tool shown in cut weighed 15,000 lbs. and had a capacity of 36 in. by 36 in. with a 16 ft. stroke.

Drop Hammer Design

From 1894 to 1921 is only 27 years, yet compare the modern steam drop hammer with the one shown in Fig. 5. Describing this machine, the maker says that the weight of piston rod and hammer, which aggregate about 3,000 lbs. in addition to a force punch, which may weigh as much more, are lifted by the direct action of steam. The machine shown was especially designed for heavy sheet metal stamping, and was said to embody many novel features. Truly it is novel, when compared with the modern type of hammer.

Press Design

In 1894, punch presses were beginning to assume, in some measure at least, the shape of our modern presses. There was a slight tendency to lean toward the ornamental, but most of that had been eliminated by this time, and we find photographs of presses in 1894 which compare very favorably in exterior appearance with those of the present day. Inclinable bed presses were also in use, but of course such vital parts as the ram, tripping device, etc., have been improved upon considerably. Straight sided, double crank, and toggle drawing presses were in vogue, although the design at that time was very little like the ones in use today. Automatic roller feeds were also equipped on presses so that it is plain to be seen designers in that period were not wasting time. Of course it is only natural that all these lines show improvement, but in the main, designers in those earlier days supplied the original idea. Squaring shears, rotary slitting shears, etc., were all in use, the design having gradually improved as time went on.

An 1897 catalogue shows a bolt tapper like that at Fig. 6. Note how the power was transmitted to the five spindles. A small bevel pinion turned the large bevel gear, this in turn, revolving the centre tapping spindle. A train of connecting gears operated the other four. Even at this early period, designers realized the advantage of the spring collet, and each spindle was equipped with this type of collet. By doing so it allowed the taps, when filled with nuts, to be removed quickly without stopping the machine. The contour, spindle design, method of driving, and so on have improved quite a bit since that time, but here again the designers had a thorough grasp of the chief idea, namely speed.

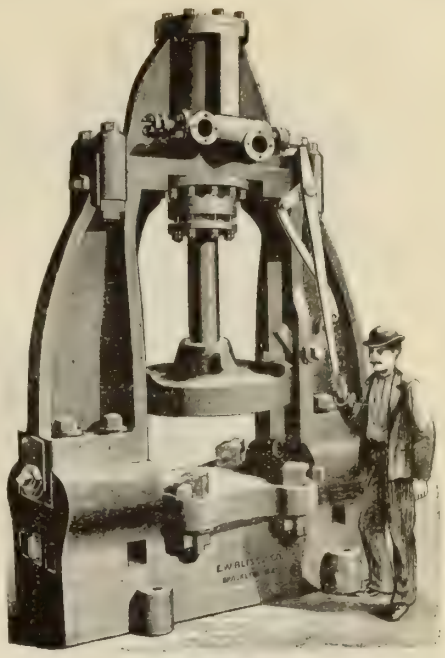

Fig. 5—Steam drop hammer for metal stamping.

The Vertical Miller

There is quite a difference between the up-to-date vertical milling machine, and the one shown at Fig. 7. Speaking about this machine in an 1897 catalogue, the maker says it was found that this type of tool was better adapted and handier for certain classes of work, and that the face mills used gave a smoother

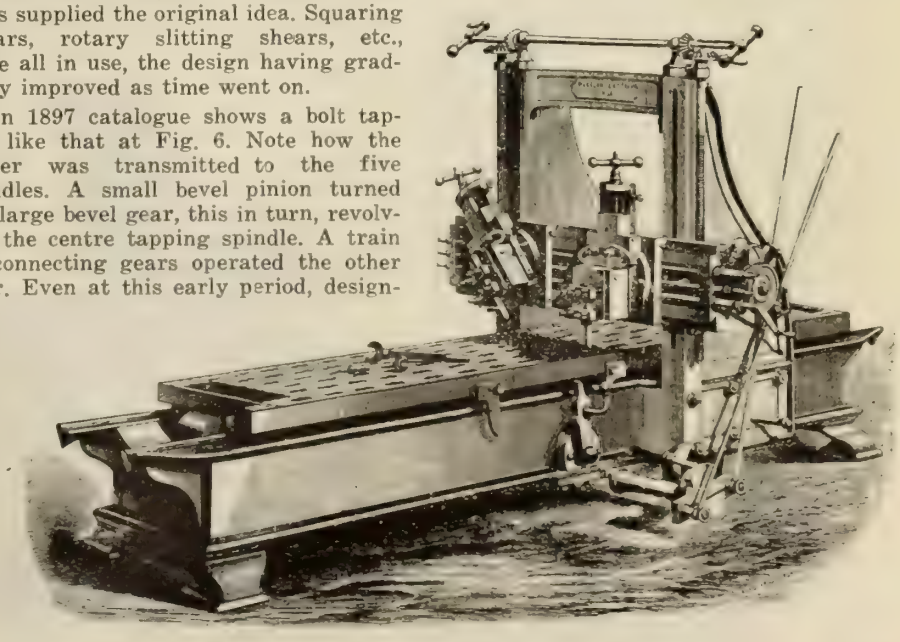

Fig. 4—Iron Planer as used in 1886.

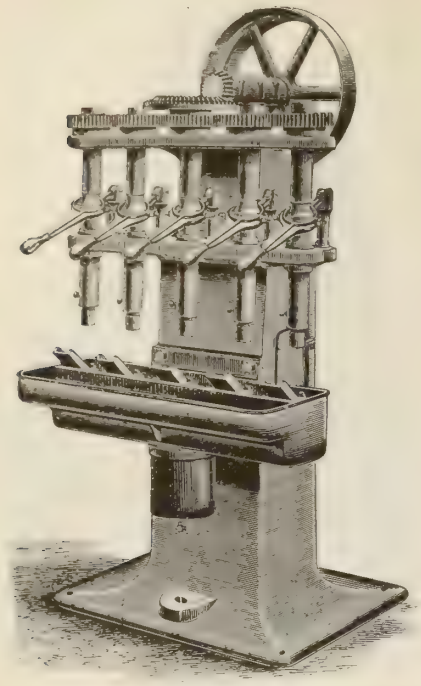

Fig. 6—Five spindle upright tapping machine.

finish than could be obtained on a horizontal machine with a surface mill. Note the gear drive to the spindle, also method of obtaining feeds, five being provided for. Designers have had an ideal opportunity to improve on this style of machine, and comparing our present 1921 models with the one shown, we can safely say that they have made good use of their time.

Column, and even traveling head shapes were in use in 1883. The column shaper in those days was a very simple affair, and while rather crude in many respects, the main underlying idea was incorporated. The style of column, the method of supporting table, etc, were very much like the shapers now in use. The refinements which have since taken place could well be termed improvements only to the original idea. Lines have been made more pleasing; machines more rugged, and ram adjustments and feed changes made to meet in with the requirements of the day. The style of traveling head shaper existent in 1883 was very much different however from the style in use at the present time. Fig. 8 shows an 1897 model, and as the picture is very clear, we leave readers to study the many changes at their leisure.

Lathe Design

So far in this article we have refrained from mentioning lathes, but this was done purposely, as up to 1890 no special improvement can be spoken of. Of course lathes in 1890, in fact long before this date, served their purpose and nicely, but rapid speed changes, speeds in geometric series, etc., were an unknown quantity. Up to about 1900, quick change feed boxes on lathes were conspicuous by their absence, but once they were installed, the change for the better was very rapid. For comparison purposes we show at Figs. 9 and 10 two lathes, the former being taken from an 1883 catalogue, and the latter from a 1901 book. Anyone can immediately see that several improvements were made during that time. The lines are better, both the saddle and apron has been improved, and the feed box added.

It will be also be noticed that gear guards have now made their appearance, or at least partially so. While the design shown in Fig. 10 is obsolete in many respects, still it is a vast improvement over former models. From this point on lathe design developed and improved very rapidly. Much better lines have been incorporated, lathe ways have been widened, higher, yet stronger castings have been made, and a wider range of feeds and speeds included. For heavy duty purposes the all gear drive has proved itself a departure worth while, and the changes in design and headstock have been especially noteworthy. The bed of a modern lathe is now of great depth, and it is usually well braced by box section girths.

Apron and saddle construction have also received careful attention, and quick change gear mechanism has been reduced to a carefully arranged science. It is nothing short of marvelous the combinations we can secure at a moment's notice on the modern lathe in use at the present time. Even the tailstock has not been forgotten, a more massive type being now used. They also have a much longer bearing than formerly, and are superior in many other ways.

Ball bearings have been largely responsible for the development which has taken place in machine tool design, this being particularly true regarding lathe headstocks. Wherever heavy duty or strain occurs, we usually find both ball and thrust bearings to take up that added duty. The cone type of lathe is likewise improved. In practically every case we now find all moving parts carefully protected, not by freakish sheet metal guards, but by serviceable covers which can be removed very quickly if necessary. In some cases these guards swing on hinges, allowing gears to be changed almost instantly.

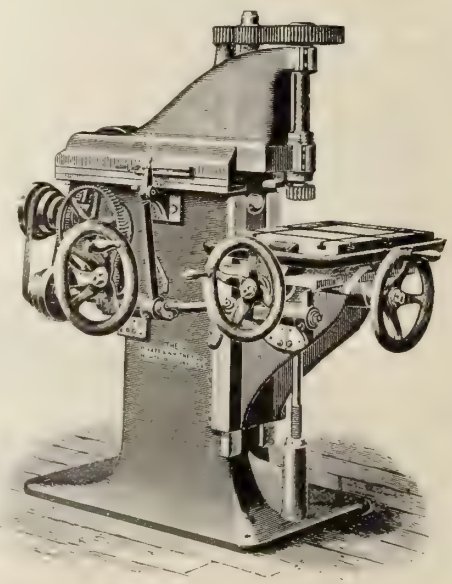

Fig. 7—A vertical miller used in 1897.

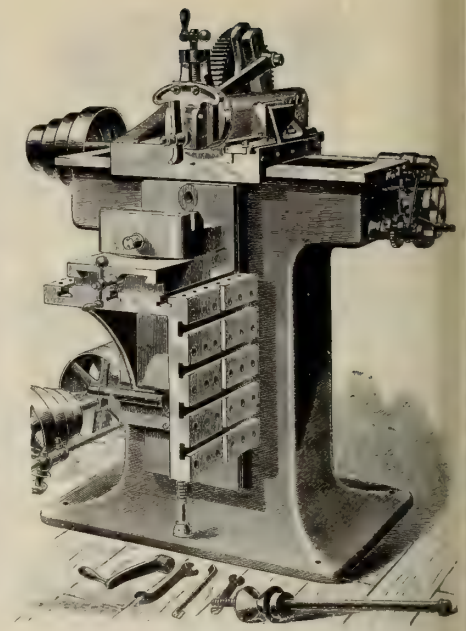

Fig. 8—Crank shaper used in 1897.

Then there is the question of motor drive. In many plants we find the individual motor drive a decided favorite. Each machine is an individual unit, and in some cases the machines are made self contained and portable. This is done by mounting machine on suitable wheels and in the case of portable lathes three wheels are usualy adopted, two at the headstock end, and one at the tailstock end. This type of machine is especially adaptable to the varying classes of work met with in railroad shops, arsenals and battleships. You can bring it up to the work, cut in on any convenient power circuit and start the machine, as the controlling apparatus is an integral part and it is only necessary to carry current to the switch. These portable lathes, in fact the many classes of portable tools now in use, are so arranged that after you get the machine to the desired location, it is the work of a moment to secure it firmly to the floor Usually either a. c. or d. c. current can be used.

As we have spoken of portable tools in our columns at different times we will not dwell further on this point but pass on to improvements which have been made to small details of the lathe such as tool posts, tool holders, etc.

In all cases better proportioned and shaped blocks have been adopted. Some favor the American type of tool post which is familiar to all mechanics, while others again believe and swear by the English type, this style consisting of two serrated plates, four studs and two clamps. Such a tool post is usually used in holding large turning and forming tools, and as the nuts on studs are tightened, the clamps hold the tool securely against the serrated plates Generally four springs, which are slipped over the studs, hold the clamps against the tightening nuts, this facili

tating the inserting and removal of tools. Tool holders have likewise improved, and now instead of heavily sectioned forged tools, we use, on lighter work especially, small tool bits ranging from ¼ in. square up, depending on the work to be done. This has been a rapid step toward efficiency, for the workman can now go to the supply room, pass in his check, and get whatever style of tool bit he desires.

Grinding Machinery

Speaking of tool bits ground to suit the workman's requirements brings up the question of grinders. We now have machines which can be set to grind almost any conceivable shaped tool. Everything has been carefully figured out in angles, and the designers have arranged such machines so carefully that semi-skilled help can produce as good ground tools as the highest type of mechanic. The machine does the work, the operator merely follows certain predetermined rules.

Of course grinding machine development has not been confined to tool grinders. Take for example the universal grinding machine shown at Fig. 11. This type was patented in 1877 and was considered a wonderful addition to machine tools of that time. If we were to place it alongside one of our modern universal grinders it would suffer much in comparison. Here again we must add however, that designers had very much the right idea in the construction of these machines, and what development has taken place is only the natural sequence of events. Many refinements have been made, but space does not permit dwelling on the features in detail. Emery wheel grinders, and polishing frames in the early eighties, were not very much like our 1921 styles. For example, Fig. 12 shows an emery wheel polishing frame used in 1897. Describing this machine the makers say that the arbors run in hard wood bearings, which are forced into iron shells. Compare this with the modern ball bearing polishing and grinding machinery, then give our designers due credit for their ingenuity.

The same story holds true of all grinding machines including disc, cylindrical, cam and other types. The original machines were very rough, but at least gave future designers the idea to work on. Now we have grinding machines that are marvels of speed and accuracy, and operations undreamed of before are performed on these tools. The automotive field owes a great deal to the designers of grinding machinery, for crank shafts, cams, tappet rods, etc., etc., could never have been produced so accurately had it not been for grinders. Disc grinding has also been a great boon, allowing designers to not only improve on the machine, but also to change the design of the part to be ground, so that the minimum amount of metal be removed.

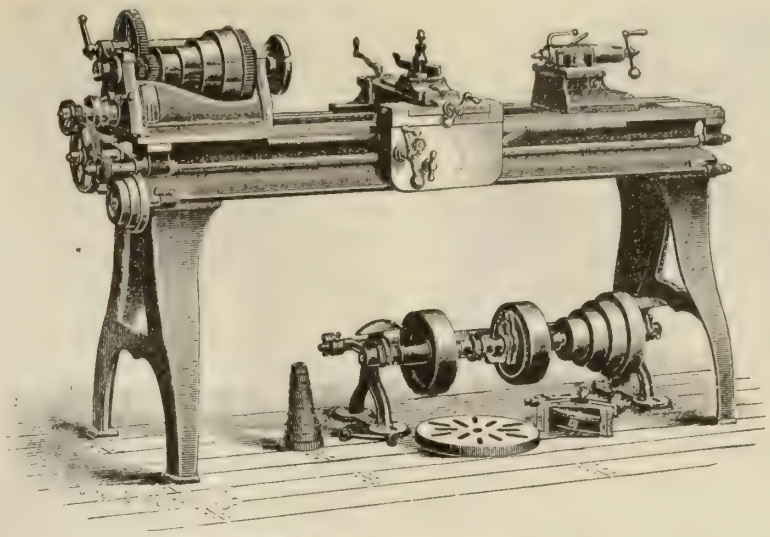

Fig. 9—14 in. Lathe used in 1883.

Lest we make this article of undue length, we must touch yet more briefly on the various tools. In review fashion here are the machines we find listed in a catalogue dated 1881. Lathes from the hand type, up to 60 in. capacity; planers from 16 in. by 42 in. by 5 ft. stroke up to 84 in. by 84 in. by 12 ft. stroke; upright drills to 32 in. and radial drills up to 60 in.; column shapers 15 in. and 24 in.; travelling head shapers 14 in.; slotting machines 10 in. to 18 in.; index milling machine used for gear cutting, etc., and small universal milling machine. Then we have the plain milling machine illustrated at Fig. 1; universal grinding machines; tool grinding machines; grindstone trough; gear cutting engine; grindstone gearing device; spur gear cutter; bolt cutter; cut off and screw cutting lathes; centering lathes; chucks of various natures; and the Westcott & Cushman chucks were listed even this is a much improved one over these far back. Of course the chuck of today former models. A few shears were also listed, but these are of the hand variety. We also find that the catalogue closes by showing differential pulley blocks which are very good considering the early date.

Another catalogue, issued only five years later, shows considerable improvement in the various lines, and from that time on, each new issue shows still further refinements. From 1894, we see remarkable improvement, until at the present time a machine tool catalogue is veritable mine of information. A noticeable feature in the modern catalogue is the frankness with which manufacturers treat their prospects. In the earlier days, manufacturers evidently did not believe in laying bare the secrets (?) of their design. Thus we were only allowed to gaze on exterior views.

At the present time, manufacturers vie with each other in presenting to the buying public the features claimed. Sectional line drawings are given; photographic reproductions of the inside of gear box, etc., are placed in a prominent position and carefully prepared artist drawings are made, when good photographs of some important part of the machine are not obtainable. In other words, a prospective buyer can sit down at his desk, probably over 1,000 miles from the plant where a machine is built, and he can almost see every part of what he proposes buying. He gets acquainted with it before he purchases, and in this way can make a comparison between the various makes. This policy has led to still further advancement in machine tool design, for it is no hidden secret that designers of one machine are not above embodying points into their own machines if they can apply it, and the

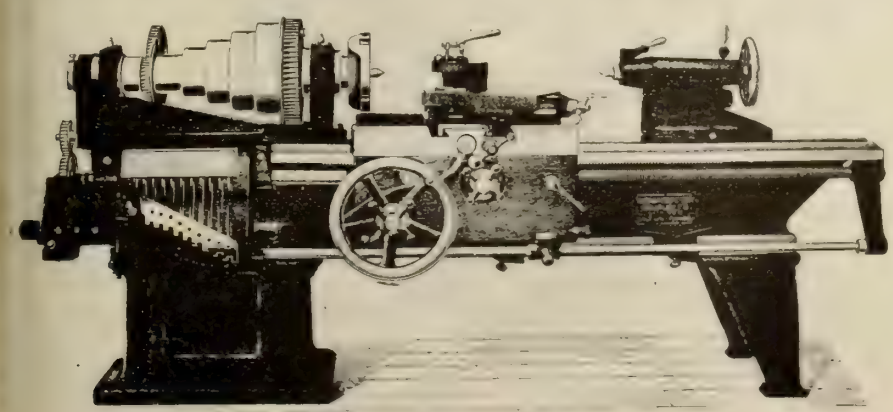

Fig. 10—Twenty inch engine lathe used in 1901.

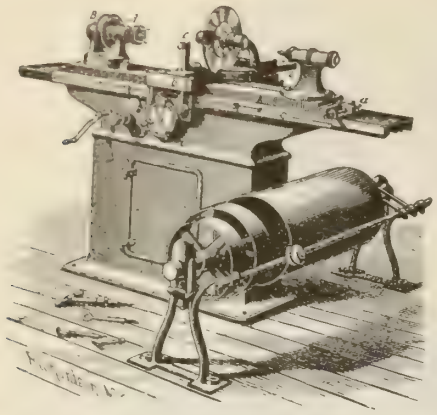

Fig. 11—Universal Grinding Machine which was patented in 1877.

feature is not patented. Instead of doing harm, it really acts as a spur to still greater efforts, for the up-to-date machine tool manufacturer is always striving to go the other fellow one better. Of course, if the feature is patented, that is another matter.

In an 1886 catalogue, we find a 42 in. car wheel boring machine, this being the forerunner of our present productive vertical boring mills. At this time we also see power driven punch and shears, and an automatic spiral cutting attachment which we reproduce at Fig. 13. Plate bending machinery, also power bending rolls appear at this date, and an upright turret pulley and wheel boring machine which is really an improved model of an old type vertical boring mill makes its appearance.

Around 1895 we see multiple spindle drills in use, these being somewhat after the type of our present wood working multiple drills. That is, universal joints, (of a kind), connected the spindles to a top gear box. Eight to ten spindles seem to have been the limit, and many were used for drilling the hubs of bicycles.

Tapping Machines

Patented tapping machines were then appearing, these varying in character, some being vertical and having three spindles or more, while others again were horizontal, and had two spindles, one at each end, the work sitting at the middle of the bed. Cam cutting machines also appeared on the market, these being made to special order only. They consisted of a lathe bed, with a sort of universal dividing head at each end operated by a handle. Alongside of the present cam cutting machine there is no comparison. Broad, deep hammers; bolt headers; jib cranes; rifling machines; gun barrel drilling machines, etc. were made to special order and Spencer's patented automatic screw machine makes its bow to the public. One of these we show in illustrative form in the heading of the article. Chucking machines and Tucker's opening die came out around this time and all sorts of power milling machines were on the market. In fact, a slabbing machine used at that time is not unlike the present Newton and Ingersoll style in use, considering, of course, the many improvements which have been embodied in the modern machines. The main idea was there, and in exterior appearance was very well designed. We even find the idea of combined drills at this period, two drill spindles being fastened to one common bed. Cutting off lathes, and many other types of lathes were in use, the design being rather crude if viewed alongside our modern machines. Most of the tools mentioned were not carried as regular lines, but were only made to special order.

Modern Tools

We could go on almost indefinately describing the gradual addition of other lines, but in preference to this course we will discuss a few of the up-to-date machines now on the market. Considering the field of lathes, we have varieties almost innumerable. There is the manufacturing lathe, the thread cutting type; standard engine lathe, quick change engine type; heavy duty automobile lathe; rapid production machine; heavy duty combination turret lathe; chucking lathes; tool room style; high duty; turret lathes of all descriptions, and in fact, machines with practically every conceivable improvement. In the shaper and planer field we find the same thing. In general appearance both machines have improved wonderfully, and in the case of the shaper, the style of table used, and its various attachments, allows a large variety of operations to be performed. The method of drive has been improved in both cases, and we can now secure an even and rigid stroke. Again we find the individual motor drive in much favor, and the neat emhtod of mounting is a feather in the caps of our modern machine tool designers.

The radial drill of today is a very different one from that in use in 1883. The bed of this type of machine is now a part of the base and an auxiliary table usually swings around the column when required. Then on top of the regular swinging table, we can mount circular tables, or in fact, almost any combination we desire. The field of usefulness for this type of tool has greatly increased during the past ten or twenty years.

In grinding machinery great advances have been made and we now have specialized machines for crankshaft, camshaft, ball race, internal, external and similar grinding work. These machines are marvels of precision and embody all the features needed for tool room and general manufacturing purposes. Shafting, rolls, taper spindles, cutters, gauges, in fact, so many kinds of work can be finished on our modern grinders that it is futile to attempt to classify them.

Then there is the bolt, nut, rivet and forging machines now on the market. These have been brought to such a point of efficiency that even a mechanic marvels at their productive capacity. To see them take a bar of iron or steel and gobble it up, spitting out completed nuts in less time than it takes to tell it, makes us admit we owe much to machine tool designers.

Air-operated tools of all kinds have also helped us to arrive at this highly specialized productive age. The development in air-operated tools has been wonderful during the past few years. Electrically operated portable tools must not be forgotten, for they too have helped to reduce production costs. Then we have the horizontal boring machine, the boring, milling and drilling machine and vertical boring mill and the many diversified lines which practically perform the above mentioned operations. The development in presses has also been marvelous and today we find huge presses that punch out and form pieces in one operation that almost make the eyes pop out of your head. To pass through a large metal working establishment where a considerable amount of press work is done, is an education in itself. The author was privileged to do so not long ago, and to see men, who

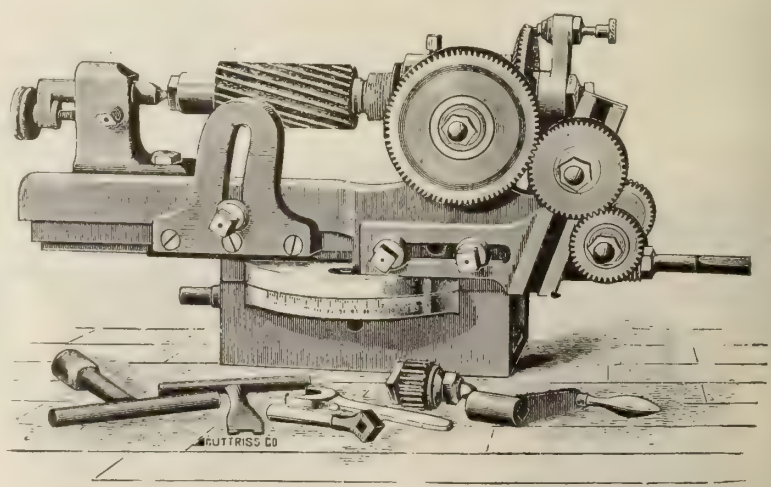

Fig. 13—Automatic spiral cutting attachment for Universal Milling Machine.

appear almost as midgets, operating machines of huge proportions is a sight never to be forgotten. It merely goes to show how designers have mastered the control of design and operation.

We also have the special purpose tool and the type of machine that is especially equipped with many cutting tools so that the work can be produced at high speed. All these have their place in the machine tool field.

Then come the many types of automatics, both large and small. What could we have done without these machines? Think of the millions of small parts which are produced yearly by the use of automatics. They have made possible the economic production of screws, nuts, bolts, etc., etc., not to speak of the thousands of other shaped pieces turned out on these machines. To stand and watch an automatic making even such a small part as a screw causes wonder. It is almost human. The rod feeds in, everything is automatic. One after another, the tools perform their work. If the head of screw is to be slotted, down comes an arm with a gripping attachment which can be likened to a human hand, grasps the screw as it is cut off, takes it up and holds it while the head is being slotted. Not content with their progress in automatic machinery, designers proceeded in the heavier class of work to supply magazine feeds to the machine, so that the operator would be able to attend to a larger number. This feature has helped the productive capacity of automatics considerably.

Bolt cutters, cold saws and other kindred lines have also improved. We cannot to attempt to cover all lines, but it is sufficient to say that the improvement which has been made to drills, milling cutters, tool steels, emery wheels, etc., has led to many further improvements in the machines themselves. As soon as milling cutters became of better quality, machines increased their productive capacity, and it has practically been a race for supremacy ever since.

We must not forget the improvement made in gear cutting and gear grinding machinery of all kinds. The development which has taken place in this branch of the industry has been very important and has helped the designers of other machinery to a great extent, as better gears make smoother running machines. The advancement made in bearing metals has been most important. In the earlier days the quality of bearings was rather uncertain, but now, bearing metals are made to very careful analysis. The class of castings has also improved considerably and this has done much to reduce weight, yet add strength to the machines.

Many types of self opening dies, collapsible taps, taper turning attachments and other production aids have all helped the cause. Air operated chucks during the war made themselves famous, as did many other labor and time saving

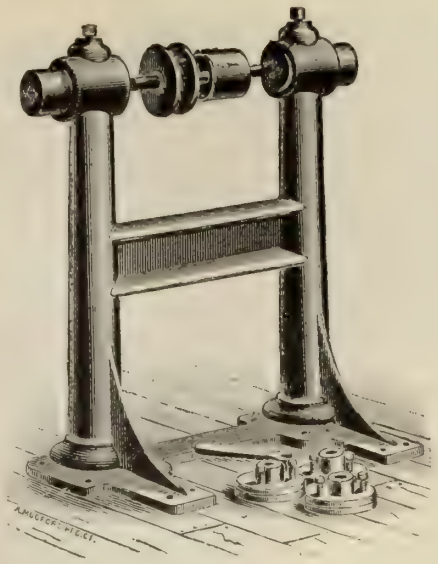

Fig. 12—Emery wheel polishing frame used in 1897.

devices. Die castings have also improved certain classes of tools and have been very useful in reducing costs on many completed articles. As stated previously, we cannot, without filling a volume, cover all lines in detail. In fact, there are bound to be many lines of development which are left out in this article, but the machines spoken of will be sufficient for our purpose. It is of course understood, that when we speak of any machine being on the market at any particular date, we do not infer it was invented at that time, for in many cases, cruder types of similar machines were made in earlier periods. The article is simply a forty year review, and in closing we can only add that the world owes a great deal to machine tool designers, and while such men do not as a rule appear before the public eye they are a great asset to any country. The past ten years especially has seen many noteworthy developments and while we are prone to look upon our 1921 machine tools as marvels of accuracy and efficiency, there is no telling what the tool designers of 1940 will be up to. A few years ago aeroplanes were a novelty. Now the first models are used only for exhibition purposes and the aeroplane has proved itself a big factor in times of war and peace. Likewise the machines in use today may be considered very old fashioned around the year 1940. Hats off to our machine tool designers. May they always be as ambitious and far seeing as they are at present.

MINERAL INDUSTRY

Continued from Page 120

mines. This year five mines are turning out gold. In short, gold mining is the bright spot in the mineral industry of Ontario at the present time, and the curve of production has a strong upward tendency here, while everywhere else it is downward.

The list of non-metallic minerals raised in Ontario is a long and varied one. It includes mica, graphite, feldspar, talc, fluorspar, arsenic, pyrite, etc. These substances form the basis of important industries. Owing to the lessened activity in trade, the demand has fallen off for most of them, and production this year will be below normal. Building materials such as stone, cement, brick and lime have usually a large output, controlled by the demands of the building and construction trades. These substances too will probably show a smaller output than in previous years. When trade revives and manufactories are once more humming, the mining industry of Ontario will quickly resume its former place. The minerals are here, and when wanted they will be forthcoming.

FOUNDRY DEVELOPMENT

Continued from page 131

vaded this territory. The crucible furnace in most improved form is still in evidence, while oil burning furnaces of various types are becoming popular. This class of foundry has made rapid strides during the last decade and today we have a large number 238 doing non-ferrous metal founding either as an entire business or as a department in the business. On the whole, Canada's foundry development has been satisfactory during the last ten years.

SHIPPING ARTICLE

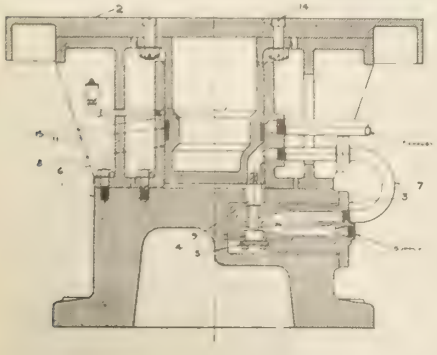
Continued from Page 119

S. is a good illustration of creating artificial restraints of trade.

However, that is perhaps verging on dangerous topics. We must go on in the most efficient manner possible, getting the production of costs of goods down a point where they meet the purchasing power of the people and leaving them a bit of money over to buy some of the little luxuries of life. Lower railway rates will have their effect on trade, as lower coal prices are having their effect in Great Britain, and gradually we shall emerge from this valley of unrest until we get on the plate of sane business. There will be no need then for agonised enquiries into what is wrong with trade, and no demand for the nostrums so freely offered by various self appointed business practitioners. Let us all work for that day.

An analysis of farm implement production in the United States is interesting. The total turned out in 1920 reached a value of $537,000,000. Gas tractors to the number of 203,000 had a value of $193,000,000; plows amounted to $40,000,000 for 1,000,000 of them; 225 wagons came to nearly $25,000,000 and 412,000 haying machines were valued at nearly $25,000,000. The summaries were made by the Bureau of Public Roads from detailed reorts of 583 manufacturers.

Foundry Development During Last Decade



Castings Are Now of Better Quality—Working Conditions Have Improved—Molding Machinery Has Proved Its Worth—Electric Furnaces Are Now Quite Common

By F. H. BELL
Editor Canadian Foundryman

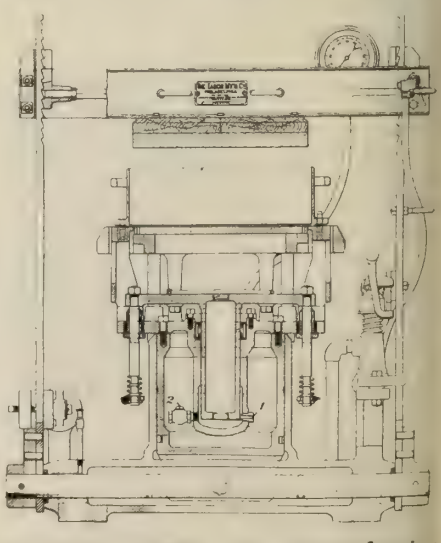
IN SPEAKING of what the last decade has brought forth in regard to the development of the foundry business in Canada, we are confronted with certain features of the situation which should be given consideration before proceeding with the real subject in hand. For instance, various changes which have been made for the betterment of the foundry have been made elsewhere as well as in Canada. Take the subjects of malleable iron and steel founding—both these branches have undergone radical changes during the last ten years, but this does not affect Canadian foundry practice any more than that of all countries. Malleable iron, which is among the pioneer branches of the foundry industry, was never what could be considered a real success, but as there was nothing any better, it was allowed to run along in a hap-hazard way until steel castings threatened to succeed it in most of the engineering fields.

Steel castings also had their drawbacks as it seemed to be impossible to produce them without having them pitted. This, however, did not materially injure their physical qualities, and steel was rapidly replacing malleable iron and would, no doubt, have accomplished its extinction had it not been for the organization of the American Malleable Casting Association and similar organizations elsewhere, the members of which threw aside all secrets and, putting their heads together, have placed malleable iron on a solid foundation by engaging experts to go the limit in the matter of research.

Pneumatic jolt-ramming molding machine.

Steel, which as we have shown, was its most formidable competitor, was also being perfected and has now become as easily controlled as any other metal. This fact is causing the grey iron foundryman to open his eyes and see what he can do to hold the ground which has so long been his.

I am just pointing out these few features of the situation so that the reader may understand that the foundry business the world over has been undergoing changes during the last few years in excess of most other lines of industry, and Canada, while only one of the many, has not lagged behind the others.



Looking Back a Decade

In looking back a decade in our history it seems but a short span, yet during those ten years the world has experienced four years of the most terrible war which savage man has ever perpetrated—four years in which foundry business was practically suspended, so that in speaking of what the last ten years have accomplished in the foundry we are to a very great extent showing what has been accomplished during six of these ten years. If, we analyse these six years we find that the year preceding the outbreak of the war was one of the worst on record, and that some of the years since the close of the war have not been what we would wish for, so that all things considered, the last ten years have not been ideal from the standpoint of comparison, but in spite of this, these ten years have been most prolific in achievements in the Canadian foundry field.

When I say that foundry business was practically suspended during the first period of the war I say it advisedly, as war calls for very little foundry work. In fact all lines of occupation had to surrender to the call to arms or else to the munition works, but in spite of this, the methods adopted in molding, and the new devices for melting the metal have advanced in a manner almost phenomenal. Molding machines while not being a new idea ten years ago, were almost entirely confined to the stripping plate variety and these were scarce in this country. The cupola furnace, which is the back-bone of the grey iron foundry, had to be modernized if grey iron was to hold its own. This has been done and old make-shift cupolas are practically off the ground today.

Results of War Not All Bad

The war, which we have blamed for standing in the way of the foundry, has however some things to its credit, and to this source we may trace some valuable improvements in the non-fer-

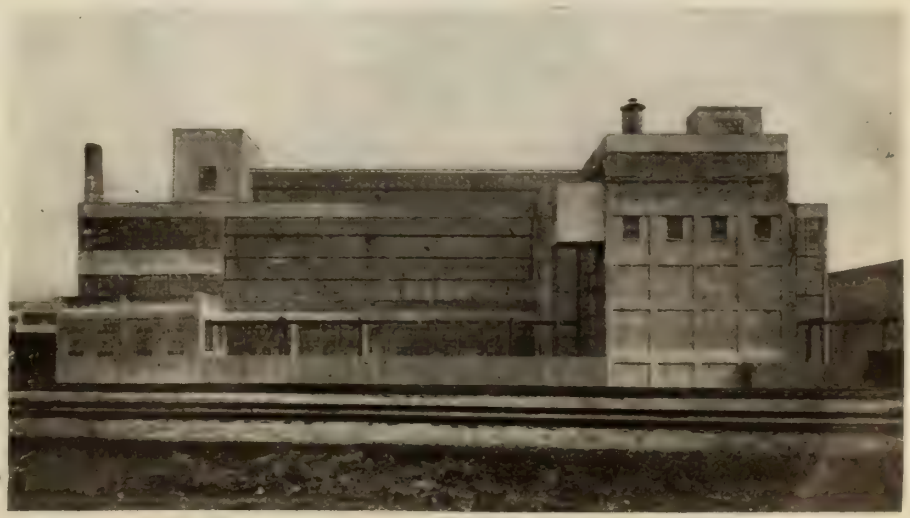
Pneumatic squeezing and pattern-drawing molding machine.

rous fields, particularly that of aluminum. What we have accomplished in the way of new industries should, perhaps, have precedence over improvements in details, so I will endeavor to show some comparisons between what we have now and what we had ten years ago.

Grey Iron Foundries

The grey iron foundry has made the poorest showing of any in regard to number of plants, but it has nevertheless held its own, and a little to the good, which is something worthy of consideration, in the face of the opposition which it is receiving from steel and malleable, as well as the depressed state of the times. The type of grey iron foundry which has been built in Canada during the last ten years will stand comparison with those of any country in the world and as examples of what is being done I will point to a few of the new foundries which have just been completed and which are in lines far remote from each other.

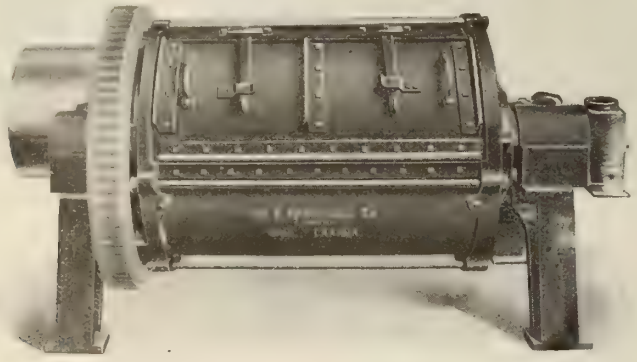
Twenty ton ladle, receiving metal from air furnace, Dominion Steel Products Company, Brantford, Ont.



Interior view, Bowmanville Foundry Co.

The Bowmanville Foundry Co. of Bowmanville, who have just moved into their new plant, (shown in the illustration,) make a speciality of very light castings, even supplying stove foundrymen who have foundries of their own, with trimmings which are too light for them to successfully produce with their regular metal. This company employs fifty-five men, thirty-five of whom are molders doing this class of work, and regardless of the times, they are busy. In another view will be seen a reverse line of work displayed at the foundry of the Dominion Steel Products Co. of Brantford, Ont.

This company makes a specialty of heavy castings which are beyond the reach of the average general foundry. To accomplish this they have two continuous tuyere cupolas, one 72 inches in diameter and the other 44 inches. They have also a twenty-ton Pittsburgh type air furnace which is used for the production of castings of exceptionally fine quality and strength, such as chilled and sand rolls, close grained rams, large engine castings and mill castings, caustic pots, etc., which were formerly imported. They also have an electric furnace of 50 k.w. capacity and an oil burning crucible furnace with a capacity of 200 lbs. per heat. In this department they manufacture brass and bronze castings of all kinds. The illustration shows the mold for a phospor-bronze bushing weighing five hundred pounds. Manganese bronze gearing and valve castings with a tensile strength of 70,000 lbs. to the sq. in., or equal to that of a steel forging, are also produced.



In another illustration will be seen an outside view of the new Grinnell foundry which was opened in Toronto a few months ago. This is a specialty foundry where nothing but pipe fittings are made. This foundry is three stories in height and the equipment is so complete that the machine operatives are little more than attendants. The molders do not require shovels, while even the sand cutting and mixing is done by machinery. These three foundries are selected, simply as examples of the way foundry work is being specialized during the last ten years. Each has its special feature, and is equipped in the most modern manner for the work it is doing. This class of foundry is springing into existence on every hand throughout the country. While the specialty shop is rapidly gaining in popularity the general purpose jobbing foundry is by no means dropping out. These shops will always be a necessity, but they must be up-to-date in order to hold their own, and to-day there are very few jobbing foundries in Canada which do not have a sand sifter, a sand mixer, also pneumatic and electric tools of different kinds, even to dustless casting cleaners.

Apart from the grey-iron foundries

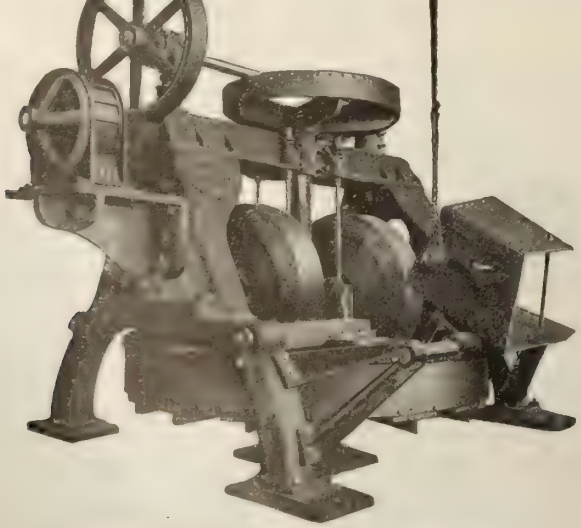
Three story foundry, the Grinnell Company of Canada.

there are the malleable, steel and non-ferrous foundries previously referred to. These are, and have been for the last decade making forward strides in excess of the regular run of grey iron foundries from the standpoint of numbers of new plants being erected, but not, of course, in type of foundry or equipment. The type

Dustless, back-geared tumbling mill.

of grey iron foundry which has been built has, as we have shown, been of the most modern, but grey-iron has its field, and will hold its own in its own field while making room for the others where they are most adapted.

Malleable Iron Foundries



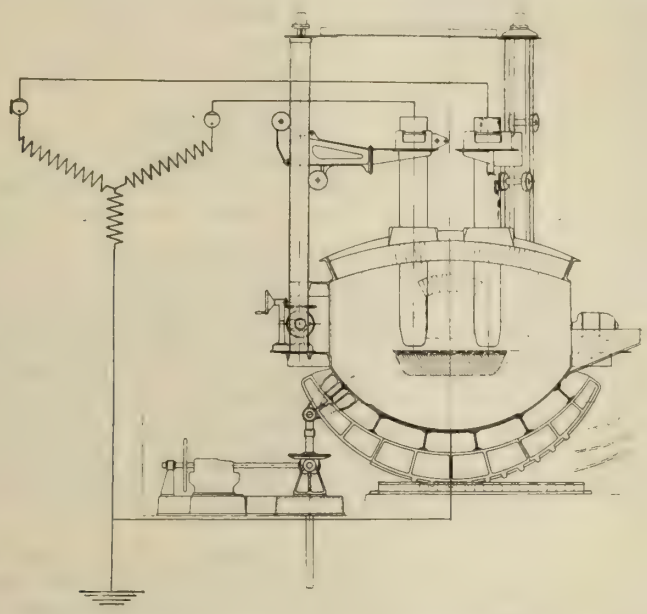
The malleable iron foundry, as previously stated, has been in existence in Canada for a period dating back almost as far as our history goes, but it was not overly progressive until recently. For many years we had a good malleable iron works at Oshawa, another at Smiths Falls and an occasional small one at a few other places, but ten years ago six or seven would cover the lot. To-day we have twenty-three modern malleable iron foundries, some of them on a very large scale. Fifteen of these are in Ontario, five in Quebec, two in British Columbia, and one in Nova Scotia. To go into details would be a big task, but among the improvements over old type of equipment, to say nothing of chemical knowledge there are such features as that of uniting several air furnaces to one large chimney and introducing forced drafts, the power for which is derived from what would otherwise be the waste heat from the furnaces after having done its work in melting the metal. This heat is used as fuel in the steam boilers which in turn supply power to electric motors.

Steel Foundries

Ten years ago we had two steel foundries producing one grade of steel castings. To-day we have forty foundries producing steel castings of any analysis required and by any process, either open hearth, converter, crucible or electric furnace. To give a list of these with their capacities and the grades of steel produced would be rather more than can be expected in an article such as this, but I will say that we have steel foundries in Canada which take orders for 50 ton pieces and pour them without difficulty; we have steel foundries that turn out manganese steel which can be bent but resists the file; we have steel foundries which produce blooms which are ready for the forge shop when taken from the mold; in fact we have steel foundries which will produce steel castings of any known variety.

Brass foundry department, Dominion Steel Products Company, Brantford, Ont. Note electric furnace and molds for heavy bronze castings.

Muller type of sand mixer and blender.



Electric Furnaces

The electric furnace has to my mind a very bright future. Canada is well blessed with water power with which to generate the electricity, and this has been taken advantage of during the last few years. Ten years ago such a thing as an electric furnace was unknown in Canada, while to-day we have no less than twenty-eight foundries with about seventy furnaces. Some of these are small but others are very large, and it might be news to many Canadians, as well as to the rest of the world, to learn that during the last ten years Canada had achieved the enviable position of having the largest electric steel foundry in the world. The electric furnace, being of such importance, and having a wonderful prospect in Canada, a list of these already installed will be of interest.

The Department of Mines of the Dominion Government compiled the following list which was correct at the time of compilation, but may, possibly, not include some of the latest installations. In fact there are to my knowledge a few which have been omitted. Following are those in the different provinces:

Furnaces in Ontario

Baldwin's Canadian Steel Corporation, Toronto, 10 six ton Herault; Baldwin's Canadian Steel Corporation, Collingwood, 1 three ton Herault; Electric Steel and Metals, Welland, 1 seven ton basic Herault and 1 six ton basic Herault Dominion Foundries & Steel, Hamilton, 2 six ton "Volta" Herault type, three-phase tilting furnace; Canada Electric Castings Co., Orillia. 1 two-ton and 1 one and a half ton, two-phase tilting; Electric Foundries, Ltd., Orillia, 1 six ton "Volta" 2-phase pig iron furnace, 1 six-ton "Volta" 3-phase ferro-alloy furnace; Electric Iron Ltd., of Lakefield, Orillia, 1 six-ton "Volta" 3-phase tilting furnace; Turnbull Electric Metals, Ltd., St. Catharines, 1 six-ton "Volta" stationary 3-phase, pig iron furnace; Tivani Electric Steel Co., Belleville, 1 two-ton 1 half ton and 1 one-third ton; and Bowmanville Foundry Co., Bowmanville, 1 one and a quarter ton Cornwall-Dixon.

Tilting electric furnace of the Greaves-Etchells type.

In Quebec we have the following:—Armstrong-Whitworth, of Canada, Montreal, 1 three-ton and 3 six ton Heroult; Canadian Electric Steel, Montreal, 3 seven-ton modified type Heroult three-phase; Canadian Brakeshoe Co., Sherbrooke, 3 two-ton, 1 one ton; Canadian Steel Foundries, Montreal, 1 three-ton "Volta" Heroult type, 3-phase, quick-melting, tilting furnace; Thomas Davidson Mfg., Co., Montreal, 4 six-ton, 1 two-ton and 1 one and a half ton; Hull Iron & Steel Foundries, Hull, 1 six-ton Heroult, 3-phase tilting; Joliette Casting & Forgings, Ltd., Joliette, 1 two-ton "Greaves-Ethell"; and Shawinigan Foundries, Ltd., Shawinigan Falls, 1 five-ton "Volta" Heroult type, three-phase, stationary furnace.

British Columbia

Port Moody Steel Works, Port Moody. 1 six-ton "Volta" 2-phase; Lowes Steel Co., Vancouver, 1 six-ton "Volta" three-phase stationary type; Opsal Steel Co, Vancouver, 1 two an da half tons, three-phase tilting; Shipton Electric Pig Iron and Steel Smelting Co., Vancouver, 1 one-ton; and Vancouver Engineering Works, Vancouver. 1 one-ton "Greaves-Etchell."

In Manitoba

Manitoba Steel Foundries, Winnipeg, 1 two-ton single-phase, 1 two-ton three phase. In addition to these the Electric Tin, Products, Brantford, Ont., have a Cobb electric furnace of two tons capacity for use in smelting tin, and the Empire Manufacturing Co., London, Ont., have just installed an electric furnace for smelting brass and bronze in the manufacture of fittings. The Dominion Steel Products Co., Brantford, also have an electric furnace, as has been shown, while the J. W. Cumming Mfg., Co., of New Glasgow, N. S. have a two-ton electric furnace which has been in operation for about six months. There are undoubtedly others which have not been brought to my attention, but those already enumerated make a fair showing for so short a time and in face of such conditions as have been prevailing.

Worthy of Note

There are other considerations worthy of note. The foundry, as a business had been neglected to a greater extent than, possibly, any other business, and although it was one of the original crafts—being practiced, by the ancients as far back as history goes, very little improvement was made in the methods adopted by the ancients until very recent date, and the last ten years will, no doubt, show more real improvements than all the other years combined. A few of the notable improvements in equipment are illustrated.

I have spoken of Canada having the largest electric furnace in the world. It might be equally as big a surprise to some people to know that Canadians built the largest electric generators which were ever made and that they are in operation here in Canada at the present time. In the illustration will be seen a dynamo base being made at the foundry of the Canadian Allis-Chalmers Co., Toronto. This base is 27 feet in diameter and weighs 48 ton. It is but one unit in one of the enormous dynamos installed by the Ontario Hydro-Electric Commission. at the Chippawa Canal development along the Niagara River.

There are many other points which might be dealt with but which are pretty well known; for instance the non-ferrous foundry. I have already shown that the electric furnace has in-

Molding 48-ton dynamo base at Allis-Chalmers Foundry, Toronto.

Decade of Canadian Railway Development

Tonnage Produced Without Transportation Facilities to Carry It to Market Has No Commercial Value—Railways Can Really Create New Material Wealth—Increases Noted in Mileage and Business.

By D. B. HANNA
President Canadian National Railways

WHAT CONSTITUTES progress in railway development in a country like Canada? If mileage is to be taken as the measure of progress, then an advance of 54 per cent. has been made in the last decade. In 1911 the mileage of all Canadian railways was 25,400. In 1920 the total was 39,196 miles.

Tonnage handled and passengers carried are measures of progress in a traffic sense, but the length of haul and journey must be considered as well as the mileage operated to get a recognized gauge of the density of traffic. Earnings and expenses must be considered. Earnings are affected by increases in freight rates and passenger fares; operating expenses by increases in wages and the costs of material. These in turn are all affected in an economic sense by the varying purchasing power of the dollar. Comparison of all these items, and some others, is however, necessarily a part of any analysis of the situation. Some comparative figures for 1911 and 1920 follow. This is only a nine-year spread. The changing conditions of 1921 would make that an undesirable year for comparison, and of course it would be impossible to get returns for some time yet covering this year.

SUMMARY OF CANADIAN STATISTICS.

1911	Item	1920
25,400	Mileage	39,196
79,884,282	Tons handled	127,388,453
37,097,718	Passengers carried	51,306,074
$188,733,494	Gross earnings	$491,938,857
$131,033,785	Operating expenses	$475,002,823
$ 57,698,709	Net earnings	$ 13,936,003
$ 74,613,738	Pay roll	$290,510,517
69.4	Operating ratio	97.17%

From the above table those who wish to deduct gloom may point out that the railways were better off in 1911 than they are to-day, measured by the operating ratio. But this conclusion would ignore many features of the case which are important from the point of view of the national welfare. Nor should the very much lower percentage of the earnings available for a return on capital be regarded as a situation peculiar to Canada. In United States the return on capital which as recently as 1916 was 6.16 per cent., fell to 32 one-hundredths of one per cent. in 1920.

Increase in Mileage

The increase in Canadian railway mileage since 1911, or seven years before the formation of the Canadian National Railways has been distributed among the provinces of Canada as follows:

Prince Edward Island	9.54
Nova Scotia	77.78
New Brunswick	399.55
Quebec	978.38
Ontario	2,678.15
Manitoba	723.30
Saskatchewan	3,027.72
Alberta	2,791,09
British Columbia	2,396.11
	13,081.62

The mileage has been absorbed by the large systems as shown below:

Canadian Pacific		3,867.17
Can. Nat. Rys.	Canadian Northern, Grand Trunk Pacific, Nat. Transcontinental	8,713.13
Other Lines		501.32

It is seen from the two tables above that of the new mileage put into operation since 1911 68.3% is in the Western Provinces, and 66.6% of the total increase has gone into what is now Canadian National Railways. Therefore on the lines now included in that system has fallen the greater part of the task of developing traffic for the new mileage. In the period under review there were four and a half years of actual world warfare, from which recovery to normal conditions has not yet taken place. That any great development has taken place in this nine year period is remarkable when it is considered that it includes only 2 ½ years of pre-war development.

The Canadian National Railways as a system dates from the time the management of the Canadian Government Railways was placed under the control of the Board of Directors which the Government appointed for the Canadian Northern Railway Company. This was done in September, 1918, after the completion of the arbitration proceedings for the acquisition of the C. N. R.'s capital stock. The management of the Grand Trunk Pacific was not taken over by the Canadian National Railways until 1st October, 1920.

It is, of course, impossible to say what greater progress could have been made since 1911 if the three railway systems had been under one management since that date. Ignoring this feature, however, we can compare the traffic handled in 1911 by the three railways with that in 1920, which will give some idea of the traffic development of the lines now included in the National System.

1911 Tons Handled	Products of	1920 Tons Handled	Increase % over 1911
2,043,464	Agriculture	7,702,435	276.93
253,342	Animals	622,153	145.58
2,728,734	Mines	7,955,072	191.52
3,227,120	Forests	7,707 435	138.83
2,199,500	Manufactur's	4 697,933	113.59
299,894	Merchandise	537,852	79.35
979,332	Miscellan's	1,109,961	13.34
11,731,386	Total	30,332,841	158.56

To convey an appreciation of what this increase in traffic means in the production of national wealth, let me point out that a competent authority in United States placed the value of the average ton of freight carried in 1920 at $143.00. The proportion of low valued commodities transported by rail in United States is greater than in Canada. In United States there is more mineral tonnage and a smaller percentage of agricultural products, so that on the average a ton of freight in Canada is more valuable than in U.S. Using the United States valuation, however, as an approximation, and deducting the tonnage which does not originate on the lines now included in the National System, the value of the additional

tonnage produced on the National System in the year 1920 over the 1911 tonnage would amount to $1,680,000,000. This sum does not take into account the differences in value of commodities in 1911 as compared with 1920. When this is included the additional value of the total tonnage originating on Canadian National Railways amounts to the enormous sum of $2,400,000,000. This is the increase in value in production in 1920 over 1911 which considers only the valuation of the articles transported originating on the lines of the National System, but this, of course, does not take into count the value which may be added to these products by various advances in their state of manufacture.

As tonnage produced without transportation facilities to carry it to market has no commercial value the railways can rightly claim credit for the creation of much new national wealth. The value of certain commodities has dropped since 1920 but the figures quoted may still be regarded as representing an approximation of the situation as no account has been taken of the increase of over 6 1-2 million tons of freight received from United States and Canadian railway connections which naturally represents a large increase in the nation's trade accounts.

As far as the entire Canadian railway situation is concerned, measured by the ton miles per mile of line (recognized as the gauge of density traffic) the country has since 1911 absorbed the 54% increase of railway mileage, because the density of freight traffic in 1920 per mile of line was actually greater than in 1911. This is one of the most important features of the comparative figures. It goes to show that notwithstanding the many unfavourable features present in the period, Canada has gone ahead in a remarkable manner and is now using on the average all of its railway mileage to the same extent it did in 1911. Canada had in 1911 but one Transcontinental line. It now has three, although two are under one management. The development of the country has been greatly extended, many new sections have been opened up for settlement. Due to the war some branch lines that were under construction in 1911, 1912 and 1913 have just recently been completed. Going back a little further, if the new towns created and new communities established are considered, it will be readily seen that the value of a railway to a country like Canada cannot be measured by its net earnings. Its effect on the National welfare must be kept in mind. Canada now enjoys better transportation facilities and is in a much more favourable position than ever before to enter upon a period of intensive development.

The fact that the Canadian National Railway System is in a position to handle a greater proportion of the nation's traffic is gradually being recognized by the Canadian people. This is shown by the larger percentage of the total traffic being handled by National Lines. There will no doubt be greater efforts made to attract new-comers to Canada of the proper type. With the gradual return to normal conditions and the resumption of immigration in pre-war volume, with the natural development of the newer districts served by many of the National System's lines which this will bring about, the relative position of the National System will be further improved and the pleasing operating results of the last four months will become the regular thing. In fact, net earnings can be expected to show a steady growth, provided that rates are on a proper basis and that the volume of business increases. It is a matter of time only, always provided of course that the railways' operations are kept in the hands of capable railway officers and business men free from the bane of political interference.

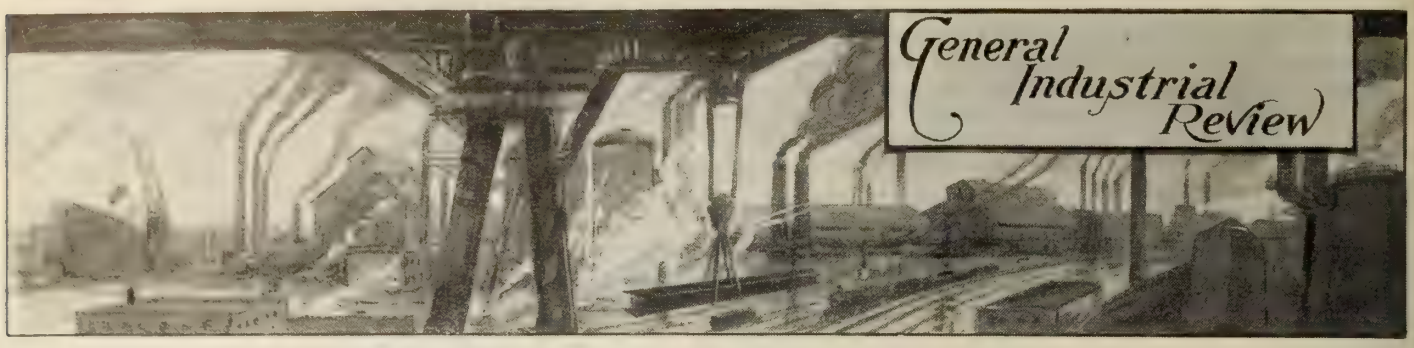
Pulp and Paper Census for 1920

Mills in operation during 1920—100, comprising 40 pulp mills, 27 pulp and paper mills and 33 paper mills and distributed as follows: British Columbia; 4 pulp mills, 2 pulp and paper mills, total, 6; Ontario, 7 pulp mills, 13 pulp and paper mills, 17 paper mills, total 37; Quebec, 18 pulp mills, 12 pulp and paper mills, 16 paper mills, total,, 46; New Brunswick, 5 pulp mills; Novia Scotia, 6 pulp mills.

Capital Invested.—$347,553,333; distributed by provinces as follows: British Columbia, $36,782,030; Ontario, $109,169,591; Quebec, $176,347,349; New Brunswick, $19,306,351; Nova Scotia, $5,948,012.

Number of employees including executives, and clerical and mill labor, 31,298. Paid in salaries and wages, $45,253,892. Distributed by provinces as follows: British Columbia, 3,015, employees; $5,617,123 in wages; Ontario, 10,071 employees; $16,151,737 in wages; Quebec, 16,223 employees; $21,305,462 in wages; New Brunswick, 1,458 employes; $1,846,775 in wages; Nova Scotia, 531 employes; $332,795 in wages.

Paper Mill Machinery Equipment.—In all mills making paper, 101 Fourdrinier machines, with a 24 hour capacity of 3,307 tons; 28 cylinder machines, with a 24 hour capacity of 824 tons. Total yearly capacity in paper of all kinds, 1,273,994 tons.



Wood consumed.—2,777,422 cords, valued at $45,404,889; average cost per cord $16.34. Spruce, 1,873,024 cords; balsam fir, 687,519 cords; hemlock, 176,029 cords; poplar, 5,732 cords; pine, 15,743 cords; other kinds, 19,375 cords, distributed by provinces:

Province	Cords	Cost delivered at Mill	Average cost Per cord
Quebec	1,333,815	$20,628,246	$15.46
Ontario	942,672	17,131,849	18.47
British Columbia	295,617	4,790,020	16.20
New Brunswick	180,723	2,553,613	14.13
Nova Scotia	24,595	301,161	12.24
Total	2,777,422	$45,404,889	$16.34

Woodpulp produced.—1,960,102 tons, of which 963,762 tons, valued at $41,772,617, were made for the producers' own use; 238,119 tons, valued at $21,998,630, made for sale in Canada, and 758,221 tons valued at $77,781,615, were made for export. Total value of all pulp produced $141,552,862, distributed as follows:

Description	Total production tons	Made for own use tons	Made for own use cost value
Groundwood	1,090,114	702,519	$23,505,693
Sulphite, unbld.	138,624	3,630	471,323
Sulphite, bl.	515,649	199,507	13,210,198
Sulphate	188,478	51,041	4,058,745
Soda	5,768	5,239	482,377
Other chem. fibre	21,460	1,826	44,281
Totals	1,960,102	963,762	$41,772,617

Description	Made for sale in Canada tons	Made for sale in Canada selling value	Made for sale for export tons	Made for sale for export selling value
Groundwood	107,079	$6,524,883	280,516	$19,958,761
Sulphite, unbld.	36,070	5,638,224	98,924	15,191,918
Sulphite, bl.	80,994	8,697,030	235,148	26,811,141
Sulphate	4,978	583,467	132,468	14,795,631
Soda	529	53,945	.....	.....
Other chem. fibre	8,469	600,081	11,165	964,164
Totals	238,119	$21,998,630	758,221	$77,781,615

CANADIAN CHEMICAL INDUSTRIES

Past Ten Years Have Shown Remarkable Progress —General Basis of Development Is And Always Will Be Our Mineral Resources

By L. E. WESTMAN, General Manager Canadian Chemistry and Metallurgy

PERHAPS the best way to get a grasp of the progress of Canadian chemical industries is to appeal directly to statistics. Going back to 1901, we find that for chemical and allied products, Canada imported goods to the value of $7,500,000, while exports amounted to $500,000. By 1910, imports had reached about $10,500,000, and exports $2,500,000. In 1920, imports were $30,000,000, and exports $22,500,000. Some growth indeed. The maximum occurred in 1919, when Canada exported the amazing total of $55,000,000, and imported around $35,000,000.

The general basis of this development is and will be our wonderful resources in industrial and precious minerals and our wealth of hydro-electric power. The chemical industry is as highly specialized as any field of manufacturing, and requires exceedingly skilled labor. Semi-popular conception of the chemical industries would confine them to pharmaceutical and medicinal preparations, but they are much broader than this, and include such operations as the production of refined nickel and the manufacture of artificial silk.

A recent list published by the Dominion Government Department of Statistics indicated the geographical location of 1,002 plants in Canada, classified as being chemical industries, properly speaking. This distribution shows at once how chemical industries follow and grow up in manufacturing districts or close to hydro-electric power.

Chemical Industries in Canada, 1921.

Nova Scotia	61
Prince Edward Island	8
New Brunswick	35
Quebec	279
Ontario	431
Manitoba	51
Saskatchewan	7
Alberta	39
British Columbia	91
Total	1002

These industries are even now passing through their most trying periods. The Canadian market, protected though it may be, is not large, and as our greatest chemical companies are concerned with selling on the market of the world, they have considerable difficulty in entering the large protected foreign fields. However, the economical basis of their operations will allow them to compete on open markets.

The principles of any chemical industry or the functions of chemists, which amount to the same thing, are two: (1) The elimination of waste; (2) the creation of new or better products. Industrial research, about which so much has been written, and which the Dominion Government and manufacturers generally have treated in such a fumbling manner, is nothing more than the application of the best brains in the country to these specific problems. That country which becomes really enthusiastic about her chemical industries and the application of sound chemical principles in research, simply cannot fail in industrial progress. Canada has the resources of all kinds, and we trust the vision. As a proof of the indomitable faith of manufacturers in the success of a chemical industry in Canada, mention might be made of the fact that within the last few months two companies began to manufacture aniline dye stuffs for Canadian textile mills, although Canada is one of the countries open to the free and unprotected sale of dye stuffs from Germany, England and the United States. This is indeed, for those who can appreciate it, the ultimate in faith and building for the future.

In a general way, it is very probable that the chemical industries of Canada will make progress out of proportion to our population growth. The essential raw materials are available and the energy to create new products from them exists in abundance. However, Canadian manufacturers do need a general awakening to the value of the work of the right kind of chemists, given the right kind of opportunity.

Much could be said about the large scale developments of individual companies, but the hope of the country consists in the proper expansion of many small but economically sound undertakings. So far remarkable progress has been made and while much of the war time expansion has passed away, a residue is left which these industries will maintain. Ten years has worked wonders in the past and science as applied through chemistry is even now just beginning to take a proper hold of our industries both basic and specialized.

PAINT OUTPUT HAS MORE THAN DOUBLED IN TEN YEARS

Paint And Varnish Industry Has Made Rapid Strides—In 1918 $15,784,610 Invested— Many Additions Have Been Made

By W. S. FALLIS, Vice-President and Managing Director Sherwin-Williams Co. of Canada

ALTHOUGH ten years ago the "Paint and Varnish" industry in Canada was an important part of the industrial life of the country, its growth since that time has been extraordinarily rapid, and the activities of this industry have now been developed to the greatest degree, through the enterprise and co-operation of the paint manufacturers of the Dominion. The greatest activity in the industry is found in the Provinces of Ontario and Quebec, but paint and varnish is manufactured in localities as widely separated as Halifax, Winnipeg, Vancouver and Victoria.

The last Government figures available are those for 1918, which give the output of these factories as $17,678,049.00. These figures were low even for the year which they covered, and as the paint and varnish business has increased very considerably since then, a conservative estimate of the volume of business for last year in paint and varnish, and allied products, would be $35,000,000.00. To produce this business fully forty-five different companies have been operated with an invested capital which amounted in 1918 to $15,784,610.00. In 1910 we find that there were only twenty-six firms engaged in the manufacture of such products in Canada, representing a capital investment of $6,277,915.00. The total output for the year 1910 was $8,041,154.00, so that it is apparent that the industry has more than doubled in ten years, both with respect to capital invested, and volume of business turnover.

The paint and varnish industry provides a market for a very considerable proportion of the country's raw materials. In the manufacture of their product, a large quantity of linseed oil is used, made from Western Canada flax. Pig lead from the British Columbia mines is another raw material which is used exclusively in the corroding of white lead, and in addition to this, the industry supplies a large home market for wooden boxes made from Canadian lumber, tin cans, commercial alcohol, creosote, naphtha, acetone, benzine, paraffin, benzol, and large quantities of pigments, dry colors and driers, so that in addition to the 5,000 employes directly engaged in the manufacture of paints and varnishes, the industry provides employment for many additional workers in the manufacture of products which it consumes.

The industry has educated the consumer to appreciate the value of paints and varnishes, not only as a beautifying agency, but also as a dominant factor in the preservation of property from decay. More and more the property owner is coming to realize that paint and varnish is just as necessary an insurance against deterioration of valuable property through the action of climate and weather, as is the possession of an insurance policy against loss through destruction of property by fire.

Due to the general realization of the value of paints, varnishes, and allied products as a factor in personal and national economy, the present depression in business has not fallen with undue weight upon the industry, although naturally it has been felt to some considerable degree.

With the stimulation in buying which is bound to come as a result of the revival in business, which is now in evidence, we who are engaged in the advancement of the interests of the paint and varnish business in Canada feel that great as have been the strides in the past ten years, the future holds an even brighter promise for increased prosperity to the industry, and constantly growing service to the community in beautifying and preserving the property of the Canadian people.

MANY REFINEMENTS IN DESIGN HAVE OCCURRED IN TEN YEARS

There is Approximately One Locomotive to Every Seven Miles of Track in Canada

By WM. CASEY, Vice-President and General Manager Canadian Locomotive Co.

THE RATIO of number of locomotives to miles of track in Canada is about one to seven, as compared to one to 2.8 in the United States, and while we can never hope for the same traffic density in Canada, as population and production increase there will be a continually decreasing ratio with a greater building program to care for depreciation.

During the five years preceding the war period—1910 to 1915—there were many more engines ordered than in the years 1915 to 1920, and while undoubtedly part of this was occasioned by the opening up of new lines, it is believed that when conditions throughout the country become normal, Canadian roads will require a much larger number of locomotives annually to provide for the efficient maintenance of their equipment.

In any comparison of the growth of the industry in the period referred to, the increase in power, weight and cost of a locomotive must be considered, as while the annual number constructed has increased from one hundred and eighty in 1910 to two hundred and twenty in 1920, the average weight of engine and tender in working order has, in the same period, increased from one hundred and fifty to two hundred tons, or in other words, the tonnage production of the industry has increased sixty per cent.

The growth for the first five years of this period was steady. As the road beds on the newly constructed lines improved, larger power was gradually adopted, and while for freight service ten years ago the locomotive of the Consolidation type was standard, in 1913 the Mikado type of approximately thirty per cent. greater weight was adopted, to be followed in 1915 by the Santa Fe type, introduced for heavy traffic on certain lines with heavy grades, and approximately a fifteen per cent. larger engine than the Mikado.

As the size of the engines increased, many refinements in design and construction became necessary, also the development and application of labor and coal saving devices—many necessitated by the increased power and weight, and all adding to the complication and cost of the machine. Whereas in 1910 the average locomotive cost for main line work was about $22,000.00, in 1920 this figure approximated $70,000.00.

The building plants in Canada and the railway companies' shops kept pace with the growth in the size of the equipment, and while during the war period the great bulk of the plants were engaged in munition work, locomotive construction was also carried on.

Export business has been started in a small way and connections formed, which under more favorable conditions it is hoped will considerably develop. In the past few years Canadian built locomotives have been shipped to Russia, South Africa, Rhodesia, Jamaica, Trinidad, France, Italy and South America, and from all reports received, the Canadian equipment has been most satisfactory and in numerous instances has led to repeat orders.

DEVELOPMENT OF ELECTRIC TOOL HARDENING FURNACES

By R. B. LINCOLN, Engineering Dept. Hiram Walker & Sons Metal Products, Ltd.

THE HEATING power of an electric current has been known a long time, but the electric tool hardening furnace was made possible when Mr. A. L. March in 1909 discovered the valuable properties of alloys of nickel and chromium as a resistance element. Before that time small electric muffle furnaces had been made with platinum heating elements. The high cost and the low resistance of platinum made it necessary to use a very fine wire of platinum foil or strip as a heating element. Such a furnace was both costly and delicate.

An alloy of about 20% chromium and 80% nickel has about seventeen times the resistance of platinum and such remarkable life, that it is used almost exclusively for the heating element of electric furnaces designed to operate below 2,000 degrees F. The first models were small muffle furnaces for use in the chemical laboratory, but a demand soon developed for a larger and more rugged furnace. Such a furnace was produced by using a heating element nearly one-quarter inch square, and a low voltage from the secondary of a small transformer.

An installation of this kind has come into quite general

A Modern Type of Locomotive Built at Kingston, Ont.

use for hardening carbon tool steel, but cannot be used at temperatures greatly exceeding 2,000 degrees F. or 1,100 degrees C. To harden high speed steel, a furnace has been developed in which the heat is radiated from stacks of carbon plates on each side of the furnace. The plates are about ¼-in. thick and 2 to 2½-in. wide and as long as the furnace is deep. They are placed one on top of the other to produce a column as high as the side of the furnace. The two stacks are connected at the top by a heavy carbon plate, and are connected to the source of energy by means of graphite electrodes projecting through the bottom of the furnace. The electrical energy used by the furnace is regulated by varying the pressure on the carbon plates by raising and lowering the electrodes.

The carbon plates slowly burn away when in use, but in so doing consume the oxygen that is in the furnace chamber and thus protect the steel from oxidation. By careful operation it is possible to heat high speed steel to any desired temperature, with practically no loss by scaling or burning.

Before the introduction of the electric furnace it was generally supposed that high speed steel should be heated to practically its melting point to get the best life from the tools. This was due to the fact that when high speed tools are heated in a fire to a temperature high enough to produce the best cutting properties, the edge is burned away by action of the flame to such an extent that the tools have the appearance of having been melted. In an electric furnace properly operated, it is possible to heat the most delicate tools to the proper hardening temperature without injury to their cutting edges, greatly increasing their life, and decreasing the cost of finishing the tool.

The greatest advantage of an electric furnace over one heated by fuel is the ease of accurate control and the freedom from noise and dirt. It is possible to obtain a quiescent non-scaling atmosphere in the furnace, and at the same time accurately control the temperature. Recently a very practical and at the same time accurate automatic temperature controlling device has been put on the market, still further increasing the usefulness of the electric tool hardening furnace. Many toolmakers prefer to do their own hardening, or at least have the tools treated in the tool room under their supervision, saving much time in insuring the tool being hardened in a manner most suitable for its particular duty. When the furnace is to be installed in a tool room, the cleanliness and quietness of an electric furnace is a great advantage.

ADVANCE IN ELECTRIC ARC WELDING

Electric Arc Welding Has Made Splendid Progress; Has Been In Commercial Use For Twenty Years; Railroad Shops Advanced Users of Process

By R. E. SMYTHIES, Engineer Lincoln Electric Co.

IT IS ONLY three years ago that electric arc welding really started to make progress in Canada. Prior to 1919 the process was in use in a few scattered steel foundries and railroad shops but had not begun to receive that general recognition from the mechanical engineering profession that is now being accorded to it. Arc welding has been in actual commercial use for twenty years or more. In Europe and America the war-time activity in the manufacture of munitions gave a great impetus to the practical application of the process to various branches of the metal working industries. Canada does not seem to have been concurrently affected to any marked extent, for some reason. This only makes more noticeable the development which has taken place since the armistice.

Out of a dozen or more firms, the names of which naturally occur to one as being the largest Canadian manufacturers of iron and steel products, to my certain knowledge only one possessed an electric welding outfit three years ago. I know only too well, because of the amount of good boot leather and lung power I expended trying to get them interested in the process, finding them almost without exception only mildly interested and very sceptical.

At the moment of writing, every one of these concerns has either installed arc welding equipment or started to make experiments in its application to some particular line of work. The start is often made by such concerns being called upon to tender on material in the construction of which electric welding is specified. It is gratifying to note how fresh applications are discovered, week after week in such plants, until it is soon found that additional welding equipment is needed. Railroad shops are probably the most advanced users of arc welding. The average moderate-sized shop engaged in the repair and upkeep of rolling stock has enough work to keep a battery of welders busy. It is used for repairing broken locomotive frames, all kinds of boiler repairs, building up worn journals and other parts, and has been successfully applied to the repair of cracked cylinders and other castings.

Another field in which great strides have been made is in the manufacture of steel tanks, containers, stills, digesters and similar equipment. In this connection it is interesting to note that in the recent explosion of pressure stills at Imperoyal, N. S., the welded joints were almost the only parts left intact.

Quite recently, some of the larger mines, mills and factories have begun to investigate the possibilities of arc welding in the repair and maintenance of the heavy machinery with which they are equipped. The Hollinger gold mines purchased a welder some months ago and from all accounts are now wondering how they ever managed to get along without it. Since Sept. 1st the citizens of Toronto have had an object lesson in arc welding, in watching one or other of the half dozen machines belonging to the Transportation Commission at work, bonding the new tracks by means of welded fish plates. During the last few years this special application of the process has come into extensive use in the United States, and there is also an ever-lengthening list of users in Great Britain.

It is also during the last three years that the job-welding shop equipped with the electric arc has sprung into existence. It is quite beyond the scope of this review to begin to describe the numerous and varied applications that the enterprising job-welder has worked out in the short time that he has been in the business. The total value of the equipment that he has saved from the scrap heap, at a relatively trifling cost, must alone be an important economic factor.

It is not desirable, however, to lay too much stress on the value of arc welding in the repair of worn and broken equipment. Too many people are inclined to regard it in that light entirely and overlook the biggest field for future development, which is undoubtedly in the manufacture of iron and steel products of all kinds.

The surface of this field has been barely scratched as yet and it is no exaggeration to say that during the next few

The electric welding of these penstocks is a wonderful achievement. They are 16 ft. diameter; made of, from ½ in. to 1¼ in. plate. Three men worked about one month on each penstock, 50 hours constituting a week's work. About a quarter of a ton of welding rod was used on one penstock alone.

years a revolution will be worked in many branches of the mechanical engineering industry by the more extensive application of electric arc welding to its processes. The low cost of electric power in Canada makes the whole subject of the greatest interest and importance to Canadian manufacturers.

TEN-YEAR DEVELOPMENT IN CEMENT INDUSTRY

By H. S. VAN SCOYOE, Canada Cement Co.

THE PAST ten years have been in many ways the most interesting in the development of the cement industry in Canada. They have included the peak point of 1913 when the total consumption in Canada reached 8,913,014 barrels. When this figure is contrasted with 102,750 barrels the consumption in 1887, or even with 1,401,419 barrels, the consumption in 1903, the importance of this industry when Canada again resumes its normal development is evident.

The per capita consumption of cement in Canada during both 1912 and 1913 was the largest of any country in the world. It is quite likely that this condition will again obtain when Canada gets back into her full stride.

The war period very seriously affected the consumption of cement; the sales reaching their lowest level in 1918 when they were less than 60% of the maximum sales of 1913. Conditions improved considerably during 1919, however, and to a still greater extent in 1920. While it is too early to give accurate figures for 1921 they will approximate those for 1920, a very satisfactory showing when general business conditions are considered.

It was not until 1890 that any Portland cement was manufactured in Canada and as late as 1903, 55% of the cement consumed was imported. Since 1912, however, the imports have been very small, exceeding 1% in only one year. A conservative estimate of the producing capacity of the mills operating in Canada this year or in condition to operate is 13,600,000 barrels which is more than 50% in excess of the consumption during the best year the industry has so far enjoyed.

It is this fact together with the fact that cement manufacturers in Canada have sold the product at cost plus a profit rather than at what the imported article would cost with freight, duty and exchange added, that has held the cement market in Canada for Canadian manufacturers.

Cement with a duty which is equivalent to 16% is not imported into Canada to-day although in many cases goods are being brought in and sold to the consumer at a price 50% more than the same goods can be bought for in the United States.

The cost of manufacture is somewhat less to-day than it was in 1920 but even now in the three main items which include more than 90% of the cost, labor, coal, materials and supplies, the costs are from 125 to 150 per cent. higher than in 1914.

Improved conditions have already been reflected in the decreased cost of cement. Nothing will give greater satisfaction to the cement manufacturers than a continued improvement and a continued decline in the selling price of their product.

BUSINESS MACHINES THE ESSENTIAL

By F. E. MUTTON, General Manager International Business Machines Co.

NO BUSINESS can successfully operate without business machines, and one only needs to survey the remarkable progress in such machines through the last decade to realize just what they mean to business. In fact, the success of any concern to-day, that will live through the keen competition, depends on just how thoroughly they are equipped with modern business machines.

The progress in manufacturing business machines that do the work instead of the human is one of the greatest factors in reducing the cost of prosperity. It is easy to prove that all that is necessary is to present to the business man what automatic machines will do for him and he will buy them. Six years ago the entire purchase of time recorders in Canada would not exceed twenty-five thousand dollars annually. To-day it reaches half a million annually, which is simply the result of a proper presentation of the great value of time.

When you save time you save money, and time is more important than money ever was. What is money anyway? Money is only a chemical combination of a clock tick and a drop of sweat. The greatest element in cost to-day is the cost of labor time, and any successful business man recognizes that he must of necessity have a printed record not only of the time he purchases from employees, but also of the time devoted to each individual operation. Without the printed record then there is the great hazard of inaccurate costs and inaccurate costs means failure.

Business machines which embody time recorders, job time recorders, time stamps, master clocks, wall clocks, tabulating machines, sorting machines, and scales made for all kinds of businesses, are really amongst the most valuable commodities on earth, for they mean speed, accuracy and economy.

There was a time when time recorders were looked upon as only useful in factories. That is all changed. They are as essential, and even more essential for the office staffs and when you go into the modern office to-day you will not have much trouble locating the time clock. Anything that teaches accuracy and method saves time. Anything that teaches order and regularity saves time, which means the reduction of the number of employes, which reduces costs, and as Herbert Kaufman says, "Never mind the Yukon and its gold. You can dig all the gold the world needs out of a time clock."

RUBBER INDUSTRY SHOWS DEVELOPMENT IN TEN YEARS

Capital Invested Exceeds Fifty Million Dollars—Over 16,000 Employees Engaged—Remarkable Progress Has Been Made

By W. A. EDEN, Vice-President Canadian Consolidated Rubber Co.

FEW industries in Canada show greater development during the past ten years than the rubber industry, which to-day stands as one of the five leaders in Canada's industrial activities. In the manufacture of rubber goods, Canada ranks fourth among the countries of the world.

In 1910 there were half-a-dozen rubber companies. At the end of 1919, over twenty companies were operating thirty-two factories. The capital invested in 1910 amounted to approximately eight million dollars. In 1920 it exceeded fifty million dollars. In 1910 less than five thousand workers were employed. Ten years later over sixteen thousand were on the pay-rolls of the rubber companies. In 1910 approximately 2,400,000 pounds of crude rubber were imported into Canada for manufacturing purposes. For 1920, crude rubber imports exceeded 20,000,000 pounds. In 1910 Canadian factories manufactured rubber products to the value of $5,000,000, and ten years later the factory value of their output was approximately $56,000,000.

In the above figures the reader has a tabloid statement of the growth and development of Canada's rubber industry, the products of which are being shipped to all parts of the globe. Exports of rubber articles, made in Canada, for the fiscal year ended March 31, 1921, amounted to $15,480,960.

The great development of this industry in Canada reflects the tremendous increase in the use of the automobile during the last decade. In 1910 automobile tires were manufactured on a very limited scale, but in 1920 it is estimated that over one million three hundred thousand automobile tire casings were manufactured in Canadian factories. Rubber footwear, too, made remarkable progress and to-day the Canadian product is the equal of the best rubber footwear made anywhere in the world. Mechanical rubber goods, such as belting, hose, packing, mattings, plumbers' supplies, etc., and druggists' rubber sundries are also important factors in Canada's rubber industry.

Rubber is of real service to mankind, and touches every phase of human life. "From the cradle to the grave" would aptly tell the story of its uses, which are countless, because rubber has many qualities. It stretches; it is air-tight and water-tight; it is a non-conductor of electricity; it has great plasticity as well as great hardness; it is a shock-absorber; it is adhesive.

In speaking of its varied uses, a prominent authority said:

"Rubber literally holds up the stockings and the trousers of the world. Infants cut their teeth on it and old age uses it in false teeth. Millions of motorists and other millions of cylists ride on rubber tires that are durable, noiseless and air-tight. Balloons of rubber float aloft and huge submarines plow their routes beneath the ocean surface propelled by electricity stored in great rubber cells. Sheathed in rubber, the lightning makes a peaceful way through our homes, offices and factories, furnishing light and telephone service. Divers sink out of sight beneath the waves in rubber suits. Rubber air-brake hose makes safe the travel of a nation. Air-drill hose rivets our ships and skyscrapers. Fire hose protects our property in city and home, while garden hose brings nourishment to our growing plants. Rubber clothing protects us against storm. Rubber footwear guards us against cold and wet. Tennis balls, golf balls and rubber-core baseballs give healthful sport to millions. In hospitals and medical work, the uses of rubber are without number. For the steam engine and connecting machinery, rubber packing has been an essential factor in the development of steam as a motive power."

As the uses of rubber are extended, the industry in Canada keep pace with the advance of science and its discoveries of will continue to flourish, because Canadian manufacturers new uses for rubber.

HAS PROVED A VERY SATISFACTORY YEAR

Milling Industry Has Completed Its First Year of Readjustment—Roller Process Was Introduced in Canada About 1880

By A. E. LABELLE, Vice-President St. Lawrence Flour Mills Co.

THE Canadian milling industry has just completed its first year of re-adjustment, (it having remained under the control of the Wheat Board until the 31st August 1920) and I think on the whole, it has proved a fairly satisfactory one, especially if compared to other concerns, who have all more or less suffered by war conditions.

The history of flour milling in Canada is most interesting and probably is the best example of the industrial development of our country; we can still see several of the old grinding stones, which were operated by hand in the North West territories, by the Indians, and of course everybody has seen many of the old windmills, which are still standing up and which were built at the beginning of the colony. I understand there are yet a very few in operation. The roller process was introduced in Canada about 1880 and has gradually replaced the old grinding stone.

In a country like ours, covering such a large area, mills had to be built at nearly every centre, in order to supply the wants of each community, the miller was always considered one of the principal citizens (in Quebec, the Seigneurs were the owners of the first mills). Gradually, these mills were changed, enlarged or rebuilt; large companies were formed; several large mills were built within the last fifteen years, until to-day there are 1,255 mills, spread from the Atlantic to the Pacific. Many of them, are very small but some are of the largest and most modern type. In fact, Canada has more large mills than any other country, except the United States, but we compare very favorably with any of them and just as efficient.

The capital invested in milling in Canada at present is $76,000,000 and its product was valued at $262,000,000 in 1920, being the most valuable production of all industries.

It must be born in mind, however, that the present milling capacity is over three times the requirements of our domestic consumption, so that in order to operate economically, foreign markets have to be found to take our surplus, our exports which ten years ago, amounted to 4,217,543 barrels, grew to 10,826,633 in 1917-18, but it has decreased since and the problem of the mill now is to export more flour, which will cheapen their cost and produce more mill feeds, of which the farmers are always short.

The one great advantage that the Canadian mills have is the quality of their flour, our wheat is the best in the world—this fact is recognized everywhere—so with proper legislation and equitable rates of freight, there is no reason why our milling industry should not develop still further and keep pace with the prosperity of our country.

TEXTILE TRADE SHOWS REMARKABLE GROWTH

Canadian Textile Mills Have Sold Goods in Spite of Keen Competition—Domestic Mills Have Grip on Home Trade

By H. H. BLACK, Montreal Editorial Representative Financial Post

Probably no industry, except pulp and paper, has experienced such consistent and permanent development in Canada during the past decade as that of textiles. This includes, in a varying degree, the departments of cotton, woollen and knit goods. Figures quoted below show a marked increase in the capital invested, value of products and number of employees. They indicate a remarkable growth, but figures are inclined to be dead unless suitably applied. To what causes, then, does the textile industry in Canada chiefly owe its healthy development?

In every branch it is forced to face as keen competition, probably, as is experienced by any trade. The boot and shoe industry, for instance, has been wearing down the competition of United States goods, particularly in men's wear and to some extent in women's. In the field of cottons, however, the goods of England had become household words in home and store, much more so in fact than in woollen and knit lines. It took years of steady salesmanship, after skilful and competent manufacturing processes, for Canadian mills

CENSUS OF KNIT GOODS

	1910	1920
Capital invested	$ 7,657,731	$ 21,311,633
Employes	4,512	5,887
Wages	$ 1 374,898	$ 4,511,325
Materials used	$ 3,154,013	$ 15,180,368
Value of production	$ 5,738,773	$ 27,516,270

to convince the wholesalers and retailers, as distributors, to accept the domestic instead of imported stocks. Among woollens, Scotch tweeds held a place all their own. As to certain French lines of silks, and some Swiss goods, no attempt has been made to dislodge them. Nevertheless in the past ten years the Canadian textile mills have, in dozens of directions, pushed Canadian-made fabrics in face of the keenest competition and they have won. More than ever before have the domestic mills a grip on the home trade. Improvements in machinery and in processes, over a period of years, have been the basis of the success won in displacing imported stocks. To-day there are few industries running so close to capacity, especially is this true with respect to cottons. The Wabasco Company, for example, is operating night shifts to make certain of the finer lines of cotton fabrics.

Advance to Finer Goods

Generally speaking the cotton industry in Canada at first contented itself with the more staple lines, without attempting the finer goods, but some years before the war mills were going into the latter, installing more delicate machines, and using the finer yarns that at first were imported. Later, they manufactured on machinery which was brought over from

CENSUS FIGURES OF COTTON MILLS

	1910	1920
Capital	$ 33,091,344	$ 58,732,941
Employes	13,041	16,124
Wages	$ 4,561,199	$ 10,981,091
Materials	$ 13,979,741	$ 43,816,517
Products	$ 24,584,931	$ 82,642,949

England. Some four or five years ago it was considered a great achievement when the Bonner-Worth mill at Peterborough installed machines for the making of fine dry-spun French yarns, and mills in Toronto, Hamilton and Paris followed. These yarns were used in some cases by the domestic mills in their own manufacturing work, and in others sold to other mills in this country; in either case they displaced yarns that heretofore had been imported from England. Practically all the Canadian cotton mills improved the lines they turned out, among them the Dominion Textile, Canadian Cottons, Wabasco, Montreal Cottons. In the last ten years the first three have easily averaged an increase in output of fifty per cent. In this period three mills, producing tire cotton, have been established in Canada, two of these within the past two years. A duck mill was started at Hamilton, and the cotton fabric mills of the Woods Mfg. Co. at Welland.

In cotton goods marked improvements have been shown in lawns, cambrics, nainsooks, dress and apron ginghams, fine shirtings, fine printed goods, etc. In the woollen mills a large number of lines of women's clothes, overcoatings and suitings are now made that were not even attempted ten years ago. There has been betterment also in men's suitings. In knit goods the past decade has probably witnessed a greater development than in any other textile department. This applies to cotton, woollen and silk hosiery particularly, with underwear and sweater coats well up. All kinds of novelties in knit goods have heen introduced. It can be said, without exaggeration, that the knit goods mills of Canada are gaining a greater supremacy in the domestic field with every succeeding year.

CENSUS FIGURES FOR KNIT GOODS

	1910	1920
Capital invested	$ 11,938,029	$ 34,149,593
Employes	8,364	12,995
Wages	$ 2,527,631	$ 8,460,739
Materials used	$ 6,904,217	$ 26,548,736
Value of production	$ 13,393,854	$ 45,052,002

The war, which injured many another industry, proved of inestimable aid to Canada's textile business. For sometime it shut off, in many instances completely, the importation of English goods, (the keenest competition), and also to considerable extent United States substitutes. The former fact was due to the changing over of hundreds of British mills to munitions work. Faced with domestic goods only, the Canadian wholesalers and retailers were compelled to try out Canadian products that had been scorned before.

A trial proved to be the mills' best advertisement and the buyers, like Oliver Twist, came back for more. Once sold, they stayed sold and to-day hundreds and thousands of new accounts all over Canada have been opened for the output of Canadian mills.

Export business is light now. It will be keener later on, but the domestic factories will face the future without fear. Their success along the enlarged scale on which they are operating to-day seems assured. But more and more they should, and no doubt will, look to the improvement of their equipment, with automatic looms displacing steadily the old-timers.

PROGRESS IN LIFTING APPARATUS

Manual Labor Is Now Superseded By Mechanical Lifting Devices—Development Has Been Remarkable For Short Time

By M. R. MELDRUM, President Herbert Morris Crane and Hoist Co.

THE DEVELOPMENT in the usefulness, practicality, speed and efficiency of hoisting machinery has been slower than the progress in some other kinds of machinery. This may be due to a variety of reasons, but among others it is undoubtedly true that people are reluctant to buy machinery for intermittent operations which can be performed by workmen without mechanical aids. The development of handling machinery has, however, speeded up during the last few years.

An up-to-date superintendent, worthy of the name, now hesitates to take men away from productive work to lend a hand on a lifting job. So development has been going on, due to a gradual change of ideas and thanks to a few persistent pioneers.

Hand operated chain hoists have been improved, simplified, made more efficient, fitted with brakes and with other effective devices. Among such improvements may be mentioned a feature to take advantage of gravity instead of fighting it, allowing the load to fall by its own weight, adequately controlled by a suitable governor.

Trolleys have been fitted with anti-friction bearings, flexible bogies for facilitating the traversing of curves and they have been made adjustable to suit different sections of track beam.

Hand operated overhead cranes have been adapted to use the most modern types of lifting gear and they have been fitted with roller bearings and with variable operating speeds. But the greatest development of all has been in electric hoists.

In the beginning, as is usual with almost all mechanical developments, electric hoists were extremely complicated. Stunts and gadgets were literally plastered all over them, all leading to trouble and requiring constant adjustment. The real genius of design consists in making a mechanism ideally simple. Each component should perform two or more functions. In a successful design it is not uncommon for one part to fulfill half a dozen purposes. The latest electric rope hoist is simple, compact, highly efficient both mechanically and electrically and it is truly portable.

This invention marks a real stage in the development of handling facilities for industrial plants and it is safe to say that within the next few years it will effect a revolution in handling methods.

METAL CUTTING PRACTICE HAS MADE RAPID STRIDES

New Steels Now in General Use Call for Higher Grade of Saw Blade—Quality and Design of Blades Have Improved

By EDWARD S. NORVELL, E. C. Atkins & Co. Hamilton Factory

THE PAST decade has probably witnessed the greatest development of cutting metal by means of saws that has ever been known. Before the war, the increased demand for metals and the replacement of wood in many articles by some metal, developed a demand for more efficient and scientific metal cutting saws, that was met by improved tools by manufacturers.

But the war demanded even more improved tools, that would produce accurate work at high speed, and that would stand up under this increased demand. Saw manufacturers were not found lacking in imagination or ability with the result that saws were made capable of meeting every requirement. How various problems were mastered would each entail a long story, if told in detail, so we will only try to outline the general process of development.

Ten years ago most steels were of the straight carbon type and the very hard alloy steels which we have to-day were not in general use. During those times, metal sawing was not quite so difficult so that the straight carbon steel saw was satisfactory. But gradually tool steels and alloy steels came into more general use, and it became difficult to find saws that would cut the new metals economically. This growing demand showed saw manufacturers a large field of business, some spending much time and money in experiments to find the proper materials and correct design to make a better saw. New saw steels were developed, and new designs perfected. High speed steel saws came into general use during the war because they would stand a higher rate of feed and cut pounds of metal per sharpening. The proper tempering of high speed steel was a difficult problem, as it is a hard material to manipulate, and failures were expensive. Since the war high speed steel saws have been perfected and are

now dependable. Semi-high speed saws are for use when the demands are not excessive.

Hand in hand with the improvement in material, the design of metal cutting saws was improved, and standard specifications have been adopted for cutting each kind of steel, and all other metals. By extensive experiments the proper speeds and feeds at which to run various types of saws to cut every metal have been determined, thereby eliminating expensive guesswork.

As wood becomes scarce, metal or other substitutes must be found to take its place, and with wood, a saw is in most cases the most economical and practical tool to cut metal. We have not discussed the development of metal sawing machines, but they have also kept pace with the times. The present machinery could not recognize its prototype of ten years ago. The modern hacksaw does not hack; the modern cold saw is really a milling machine; the band hacksaw machine is new altogether; and the former wood cutting swing saw is a most valuable metal cutting machine, when equipped with the proper blade. In closing this short review, we wish readers to remember that the performance of any metal cutting machine depends greatly on the blade that is used.

AUTOMOBILE INDUSTRY CLOUDS NOT WITHOUT BRIGHT LINING

Estimated Replacements for Coming Year Said to Furnish Opportunity for Fair Business Despite Dullness in the Trade

By J. M. ELSON

A GLANCE back over the conditions which have prevailed in the automobile industry for some time can lead to only one conclusion. There is a long way to go before they will be back to anything like normal health. Men engaged in the various branches of the trade, like their fellows in other departments of business activity, are hopeful that 1922 will witness an encouraging improvement, but hard facts do not permit of much enthusiasm. The strongest real factor, perhaps, entering into consideration is that of necessary replacements. At least, aggressive men who feel that there will be business to be had for those who go after it, estimate that on a replacement basis there will be enough trade to make a fairly substantial market.

It is obvious to even a casual student and observer that the industry has suffered heavily by the depression which has existed. With tight money came a low buying power and a tendency on the part of people to avoid expenditures involving any considerable sum of money. There must always be a bottom, of course, to every trough, and it is considered by men who are in a position to read signs, that the trend of events in the future will be upward. During 1920 and 1921 there was a decided quietness, a quietness which made presidents and managers of companies knit their brows, but if anything is said now it is with more optimism.

One of the points made is that the rapid decline in the cost of materials and the consequent reduction in the prices of cars will have the effect of stimulating buying. Whether this is speculative or becomes a fact next year will have to prove itself but it is a peg on which a salesman can hang an argument. In almost everything except cotton the drop in the cost of manufacturing automobiles has been sharp. Steel, for instance, has gone down 40 to 50 per cent. Labor is cheaper and, of course, very plentiful. Rubber, too, is down as well as various other materials used. Sometime ago the industry anticipated these things and reduced the prices of cars.

INCREASE IN PRODUCTION

The rapid increase in the production of automobiles from 1916 to 1921 is shown in the following statistical report:

Year	Total Production
1920	402,929
1919	322,887
1918	268,960
1917	198,878
1916	120,318
1921 production to October 31st	178,575

Canada's Automobile Business, export and import.

Comparative figures of export and import business done by Canada in automobiles show a large trade in 1919-20, with a decided falling in the six months of 1921, ending with September. The imports were as follows:

Freight	$2,142,477	$2,693,543	$1,080,537
Passenger	5,864,484	6,388,031	6,219,053
Automobile parts	5,410,424	8,384,161	4,951,232

Financial Features of the Industry are:

Capital invested by manufacturers of cars	$43,467,000
Capital invested by manufacturers of materials	5,450,000
Capital invested by manufacturers of parts	19,678,182
Capital invested by manufacturers of tires	43,691,869
Capital invested by dealers	44,176,000
This makes a total investment of	$156,463,051

Replacement Prospects Are Good

Of a more substantial nature, however, is the statistical record on which the trade bases its outlook. It is pointed out that the average life of an automobile is around ten years. Taking the number, therefore, which were sold in 1912 and which would have to be replaced in 1922, there is a good amount of business to be done even if new buyers and owners are not found.

In Canada, as in the United States, there is a strong public movement for improved highways. This, undoubtedly has come about as an outgrowth of the rapid increase in the use of motor form of transportation, but whatever the cause it is a fact and in several of the provinces large sums of money are being expended by governments to build and improve trunk line roads. With the existing popularity of the motor car and the motor truck, coupled with the continued development of highways, it is held by many in the automobile business that the pendulum is bound to swing back soon.

For instance, the total number of cars registered in Canada in 1913 was only 220. For 1920 the registration ran up to well over 400,000. Figures available up to the end of October 1921 give the registration for Ontario as 178,575 and it is estimated hat for the year 1921 now closing the total will be over 180,000. Figures given herewith show the rapid development in five years.

Rapid Growth in Registration

In the United States the growth has been remarkably fast. The number of cars registered in that country in 1916 was 3,687,000, whereas the total registration in 1920 was 9,118,000 or almost three times as many.

Incidental features in connection with motor traffic indicate so far as figures can be secured that of all the cars used in Canada 90 per cent. are for business purposes of one kind and another; that from an automobile standpoint the best county is Kent, which has one car to every nine people; and that 74 per cent. of all cars sold come within the $1,000 or less class. This estimate is based on known conditions in Ontario and Western Canada. The remaining 26 per cent. is divided among 140 makes of cars.

In connection with the probable production for the coming year it is calculated that for replacements alone there will be 65,000 cars sold. Should a fair percentage of new buyers be located this output would of course be greatly increased. The estimated production value of cars put out in Canada reaches the big total of $377,480,047. In Ontario alone, last year 41,747 cars were sold. Replacements for the same province are estimated to be 29,000 for 1922.

Statistics gathered by responsible bodies and firms show that the growth of the motor truck as a means of transportation has increased enormously and that its future promises to be much greater with the new highways. Business houses are now shipping all kinds of short haul business by motor transport up to 60 and 80 miles. If this branch of the trade grows as rapidly as expected and the replacement output is

anywhere near what is hoped, the coming year should see a gratifying improvement in an industry in which enormous sums of money are invested and equally large sums are paid out in wages when plants are running.

INDUSTRY HAS UNDERGONE MANY CHANGES

Price of Sugar in 1920 Reached Higher Point Than at Any Other Time in History of Industry—Future Holds Forth Better Things

By JOHN D. LOWRY, Atlantic Sugar Refineries, Ltd.

THE sugar industry in the past eight years has undergone great changes. In the year 1920 prices for raw and refined sugars reached a higher point than at any other time in the history of the industry. During the American Civil War refined sugar retailed in parts of the United States at a higher price than it did during the year 1920. This, however, was a condition local to the United States; and it was for the world war just past to create conditions which were world-wide in their effects. At the outbreak of war the world's greatest sugar market was Hamburg, and while all the sugars of the world were not bought and sold in Hamburg, it was in Hamburg that the price of raw sugars was established. With the changes that occurred in 1914, New York became, and is at the present time, the great sugar market of the world.

With the outbreak of war the beet sugars of Europe, heretofore a dominating factor in the world market, ceased to exist as such. As the war progressed the sugar-producing countries of Continental Europe, whether enemy or ally, were unable to produce enough to meet their own requirements. France and Belgium producers with a greatly curtailed production; and Great Britain a non-producer, and dependent upon the Continent for her supply, were forced to look elsewhere for sugar. This demand stimulated production in all cane sugar producing countries of the world. And through the war the production of cane sugars increased, while beet sugar production in Europe decreased.

The graph shows the production of cane and beet sugars from the crop years of 1912-13 to 1920-21, and from it may be seen to what extent the beet sugar industry of Europe has suffered. Cuba producing more cane sugar than any other country showed an increase between 1912-13 to 1920-21 of 1,507,503 long tons. The crop of 1912-13 being 2,428,537 and the crop of 1920-21 3,936,040 long tons. The graph also shows an increase in production of European beet since the crop of 1919-20.

To predct how long it will take for European production to reach pre-war figures is impossible; the sugar beet crops are directly affected by unsatisfactory general conditions, and with the revolutionary changes that have taken place over a large portion of the beet-growing areas of Europe, the owner of large lands has given way to the peasant as a small-land holder, and the latter is more intent upon growing a crop which he can store, and consume within his own family, than in growing such a crop as sugar beet.

In 1919 and the early months of 1920 a large portion of the Cuban crop was purchased abroad; thus greatly curtailing the stocks available for the United States. The United States with average yearly increase in total sugar consumption over the past ninety-seven years of 5.313%; with a total consumption of 85.43 lbs. for the same year was confronted with an apparent shortage. Early in March 1920 a buying movement that is without precedent commenced in the raw sugar market, New York. On the 9th of March Cuban 96° centrifugal sugars sold for $10.00 per 100 pounds, cost and freight New York. From then until May 19th the price advanced rapidly and on May 19th sales were recorded of these sugars at $22.50 per 100 pounds cost and freight New York (these quotations without duty).

The foreign buyers earlier referred to as having bought a large portion of the Cuban crop, re-sold during this advance to buyers of the United States, a large percentage of their holdings. At the same time sugar-producing countries throughout the world attracted by the high prices obtainable in the New York market sold even to the extent of causing a sugar shortage within their own boundaries.

Imports of full duty paying sugars into the United States in the year 1920 were 885,868 long tons; whereas in the previous year about 60,000 long tons were imported. From an

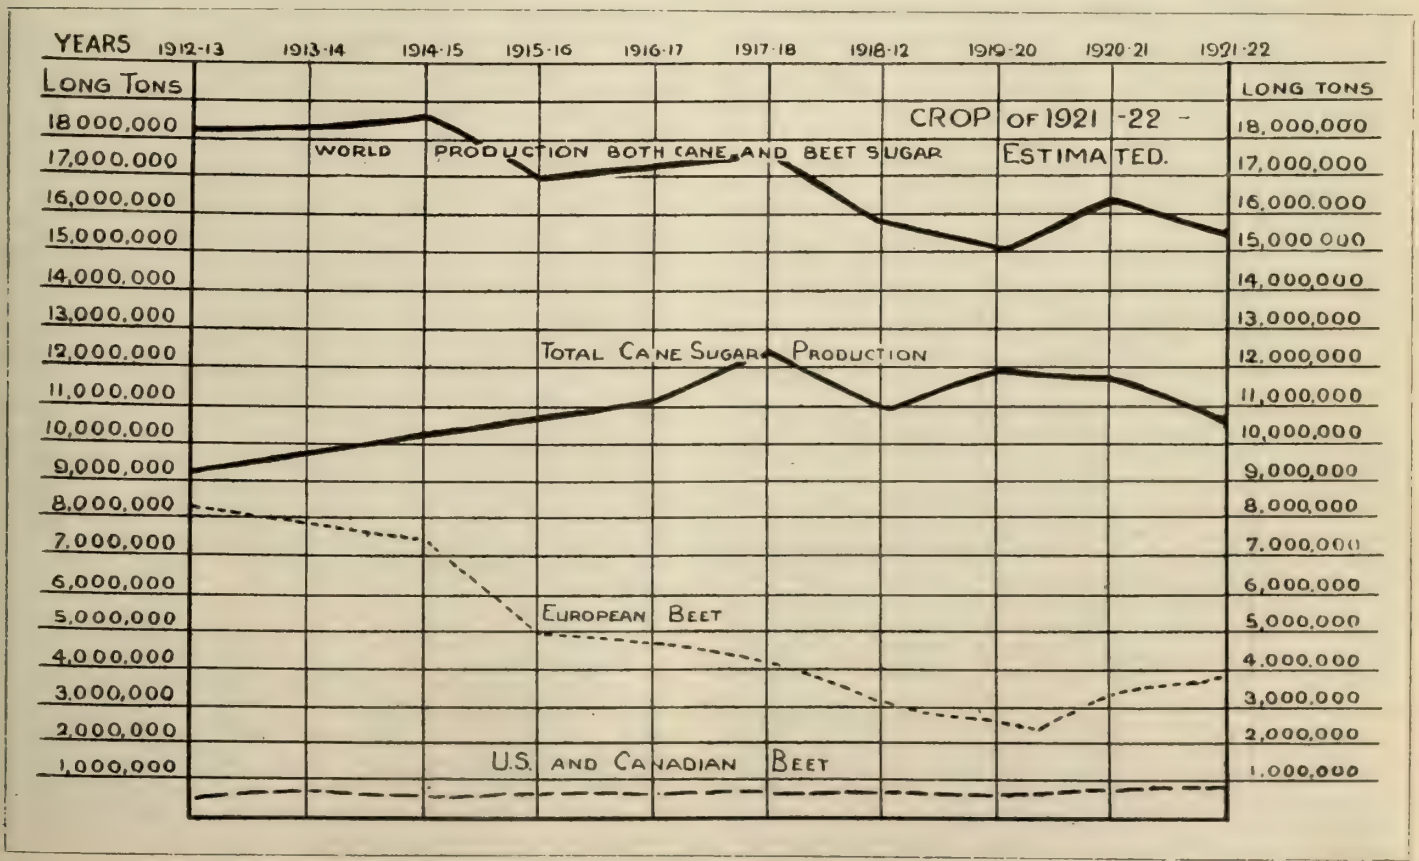


Chart showing production of cane and beet sugar since 1912.

apparent shortage, an over-supply was thus created. In the last week of May a decline in prices commenced, which was very rapid; on the 14th of December 1920 the low figure for the year was reached, Cubas selling for $3.625 per 100 pounds cost and freight New York. Government control in the United States was operative between October 1917 and December 1919.

In Canada the sugar industry was controlled by the Government from October, 1917, until July, 1920. In each case purchases and sales were entirely in the hands of the Governments, refiners working on fixed margins. In Great Britain control lasted until the end of February, 1921. In Great Britain the control body dissolved showing a net loss through its operations in sugar of some 24,000,000 pounds sterling.

In Canada, for the first six months of 1920, with the exception of one, and one half months from the middle of February to the end of March, the Government forced refiners to sell refined sugar at a price actually below the cost of raw sugar. Such action caused Canadian refiners alone to sustain a loss estimated at thirty million dollars. This apart from losses of others directly and indirectly associated with the sugar industry.

The year 1920 in passing left conditions to say the least chaotic; at no time during the present year of 1921 has the raw or refined sugar markets shown any sustained firmness. The refiners' price of granulated sugar at the time of writing is $7.135 net per 100 pounds Montreal basis, which when the restricted purchasing power of the dollar is considered, is back to a pre-war basis. It may be said for the sugar industry of this continent that it has passed through the storm; and from those who look into the future greater optimism is being expressed, now, than at any time for many months past.

MARKED CHANGES IN DESIGN

The General Purpose Machine Is Again With Us —Strides Made in Electrical Distribution Causing Changes to Methods of Driving

By R. M. HAMILTON, Works Manager Canada Machinery Corporation

A FEW YEARS prior to 1910, and since then, has seen very marked changes in designs of ironworking machine tools brought out by the introduction of high speed steel, practically all types of machine tools lacking rigidity and not having power and speed equal to the marked improvement in cutting steels. The years previous to the war also saw the development of complex machines designed to do the various machining operations required on one piece in one machine.

War experience on shell work showed that this type of machine was not the most efficient on repetition work, but that the method of doing a single operation on one simple machine with speed and feed suited to the work was much better, and many manufacturers thought that great progress had been made in methods of manufacture for all time.

We believe, however, that experience since the close of the war has proven that war methods were only applicable to war times excepting in specialized industries such as the manufacture of automobile parts or similar work which can be made in great quantities, and apparently the time of the general purpose machine is again with us.

The strides made in electrical distribution are causing changes to quite an extent in regard to the methods of driving and the supplanting of continuous current by alternating is resulting in many machines being now designed with all speed changes being taken care of by quick change drive gears, although we believe it will be many years before the individual motor drive will supersede the group method of driving, as first cost is not the only objection to individual motor drive on small machines.

In regard to woodworking machinery, the high wage rate prevailing in recent years has forced the design of machines of greater production and all first class factories now have to study methods and machines that will lower the labor cost. It has recently been demonstrated that on ordinary revolving cutter head machines, it is one cutter only that does the finishing, owing to probably one of three things, viz: lack of rigidity in machine design, lack of running balance or bad setting of the cutters. Given a machine well built and rigid, with heads and spindles in perfect running balance, and with the knives ground and jointed in place, the feed of the material per minute can easily be increased fourfold with work equal in finish. While this reads as being quite simple, it is a lot of work for the manufacturer of machinery and means a radical change in design in most cases.

In addition to this, there are quite a number of machines designed on the principle of one knife finishing, and the speed of the cutter head increased to the limit of endurance of the knife. This means in many cases spindle speeds of eight thousand revolutions per minute and over and is accomplished very nicely by ball bearings specially selected for accuracy.

Motor drive is another departure from old lines, but in the Niagara Power Zone, progress in direct connected motors on woodworking machinery spindles is handicapped by the twenty-five cycle current furnished, as the cost of the electrical equipment necessary to get the high speed is almost prohibitive.

CANADIANS ARE HEAVY USERS OF SHEETS—PROTECTION NEEDED

Successful Making of Galvanized Sheets Goes Back to 1915—In 1917 Black and Blue Annealed Sheets Were Made

By A. T. ENLOW, President and General Manager Dominion Sheet Metal Corporation

THE ENTRY of Canada into active participation as a manufacturer of steel sheets is of comparatively recent date. There was an unsuccessful attempt in 1910 to roll black sheets in a plant at Morrisburg, Ontario, but the company was unable to make headway and in 1912 the plant was closed. The location in Morrisburg was extremely illogical and evidently had in contemplation the assistance of the leader of the Ontario Government, Sir James Whitney, whose home was in Morrisburg. The expected political help did not eventuate, and, having nothing in its favor otherwise, the proposition naturally languished.

In 1915 a plant was established in Hamilton for the manufacture of galvanized steel sheets, which has been in continuous operation since, and from this source the galvanized sheet requirements of Canada throughout the war period and later were largely supplied. In their Hamilton plant the Dominion Sheet Metal Corporation have a capacity for supplying up to 25,000 tons of galvanized sheets per annum, and as the normal requirements of the Dominion are fully double that amount, it would appear that the future developments might well be assumed to be promising, although the recent high prices such as in effect in 1919 and 1920 cut the Canadian consumption to a minimum of less than 25,000 tons.

In 1917 the abandoned sheet mill at Morrisburg was bought by the Steel Company of Canada and brought to Hamilton, where it has since been operated in conjunction with their open hearth and blast furnaces. Two hot mills with auxiliary equipment have been operated until recently when a third mill was started, leaving a fourth available for further expansion. The output of three hot mills would be approximately 18,000 tons per annum, the product being box annealed black sheets, blue annealed sheets and uniform color and special stamping stock, as well as single pickled and oiled sheets.

In 1919 the Baldwin Canadian Steel Corporation located in Toronto, and took over the plant used throughout the war by British Forgings, Ltd. Due to the feverish activity in all lines of trade in 1919 and the first half of 1920 the company was not able to get into operation as soon as anticipated, and while both black and galvanized sheets have been made to date, their operations have mostly been in tinplate. The Baldwin Corporation has available eight hot mills for making sheets and tinplate, which, however, have not yet been reduced to a basis of systematic operation. They buy their sheet bar

requirements from outside sources, the bulk so far being from the United States.

In view of the foregoing it is evident that Canada has at least made a start as a producer of sheets, and as it is well known that Canadians are the largest users of sheets per capita in the world, it would appear logical that the powers at Ottawa, whatever their politics, do what they can to assist in raising the country to a self-contained basis. The tariff on sheets is extremely low, being 7½ per cent. from Great Britain and 12½ per cent. from the United States, and while the exchange rate has been an additional protection to a small extent during the last two or three years, yet this may soon be inoperative if the troubles of the English and Welsh producers are eliminated.

Very little in the way of sheets has come in from Great Britain from 1919 to date, because their costs have been high and operations unsatisfactory. With rapidly reducing costs, low ocean freights and a 10 per cent. below par pound sterling one may easily conjecture that the local producers may soon have the bulk of their competition from across the water, and the preferential tariff rate may be found so low in view of below par English currency that an effort will be made to adjust tariff rates upwards if the industry is to succeed in establishing itself here.

Canada's rate of duty from Great Britain is only one-third that of the United States import rate from outside sources and yet they profess to be alarmed in the United States as to what may occur when costs drop to normal in overseas mills. The next two or three years will tell whether Canada has a sheet industry of its own, or continues with the "moss-back" policy of letting the outsider furnish its requirements.

STEEL MAKERS OF CANADA HAVE INCREASED CAPACITY

Steel Must Be Manufactured in Advance of the Actual Requirements—Canadian Mills Well Able to Carry On

By C. W. SHERMAN, President of Dominion Foundries & Steel, Ltd.

STEEL is the base of industry. Any country's development or position in this world can be measured by its steel-producing capacities. Steel is like a railroad through a virgin country; it must be manufactured in advance of the actual requirements. All industries are dependent upon steel or machines made from iron and steel, and if any industry contemplates starting operations in Canada, one of the first questions which will be considered is that of the proper supply of steel or machinery.

Prospective industries need no longer hesitate about such supplies. The steel makers of Canada, during the past ten years, have so increased their capacities and widened their range of products that Canadian industries can carry on practically independent of the outside world insofar as their steel requirements are concerned.

Canada's demand for steel steadily increased each year from 1910 and the Canadian steel makers anticipated these needs mostly by enlargements to their existing plants. In the fall of 1914 and beginning of 1915 the steel makers of Canada were suddenly confronted with an avalanche of demands for steel for war needs: the Imperial Munitions Board wanting steel for shells, guns and other munitions; the shipbuilders needing ship plate, rudders, propellers and etc.; the railroads with their orders for rails and steel parts for their locomotives and cars; the machinery manufacturers making their insistent demands for their needs, until the total yearly demands reached a point where it was a million tons greater than the normal capacity of the steel plants then existing.

Canada's normal steel-producing capacity before the war was approximately 900,000 tons yearly. By 1918 she had more than doubled this capacity, government statistics crediting Canadian steel makers with a total production for that year of 1,873,708 tons of steel. Compare these figures with that of twenty years previous when in 1898 Canada's total yearly steel production was only 24,125 tons.

Armistice day found Canada possessing more than a score of steel plants which, for the most part, had been developed specially for war needs. In order to prevent wholesale scrapping of these huge developments the steel manufacturers set to work to revamp their plants to produce needed steel products still insufficiently produced in Canada.

Canada's steel development has out grown the existing tariff. Our present tariff can be revised in many ways that will benefit the producers without increasing the average cost to the consumer of steel, and at the same time be of great assistance in correcting our adverse trade balance. While Canada's markets do not demand or permit the developments of such huge steel works as now exist in the United States, her modern steel plants stand second to none in efficiency, and in the quality of their products.

PAST DECADE HAS SEEN MANY IMPORTANT DEVELOPMENTS

Over 15,000 Are Employed in Automotive Business in Canada—Attitude of Business Men Towards Motor Car Has Entirely Changed

By T. A. RUSSELL, President Willys-Overland Co.

THE PAST ten years in the automotive industry has been marked by a development which has placed this industry as one of the most important in the country. The secretary of Automotive Industries of Canada has compiled some detailed statistics which are full of information to illustrate this. I wish only to quote a few of the outstanding features.

Ten years ago the industry was one of our smallest. To-day there are over 15,000 people employed in Canada with an investment of approximately $50,000,000, and an annual payroll in excess of $15,000,000. In Ontario the license fees in 1911 were $50,000 a year. In 1920 they exceed $2,000,000 and the Provincial Treasurer is now counting on them as being dependable for an annual income to the Province of $3,000,000. The total number of licenses issued in all of Canada in 1910 was 8,937; in 1920 this had grown to 402,929. Seven companies are manufacturing motor vehicles in Canada, and the value of their output in 1920 was approximately $93,000,000. Some of these plants are most complete. One company claims over 90 per cent. of the parts entering into it are made in Canada. One company with which I am identified, has an equipment which rendered it capable of producing five fighting aeroplane engines of over 200 horse power each every eight hours, when the need of the moment was for munitions of war.

The attitude of business and business men towards the motor car is entirely changed. Ten years ago it was regarded as a luxury and its use confined to the few. To-day it is recognized as one of the great utilities of the country, adding to the efficiency of men in all walks of life, taking its place with the telegraph, telephone and other inventions in adding to the efficiency of the individual in business. Ten years ago scarcely a single farmer owned a motor car. To-day, a moderate-priced car is regarded in the light of an agricultural implement of daily benefit on the farm.

The last year and a half has seen the industry meet conditions of curtailment in business, which would have threatened its very existence had not the industry been well founded and actually meeting the daily need of the people. Instead of there being evidence of a declining use of the motor car, there it every evidence of continued extension of its sphere of usefulness. While the buying power may continue low for a period, long or short, the motor car has demonstrated it has a function to perform and that the industry is therefore secure.

Up to date, general data has shown that the average car drops out about five or six years after its manufacture, so that there is a continuing business ahead of us in replacement alone, equal to the business of the corresponding period, five or six years back. There will be more discrimination in buying in the future. The public will judge more keenly between cars which are attractive and economical and durable, as against those which have these advantages to a less marked extent. They will discriminate more in favor of cars which are able to give good service, replacement of parts, etc., as

against those whose facilities are less satisfying. There may be less of a tendency to buy extravagant cars and more insistence upon cars in the economy class, but that there is a continuing business of large volume in front of us, no one at present can reasonably doubt.

TRANSPORTATION METHODS HAVE ADVANCED RAPIDLY

Automobile Manufacture Has Developed Quickly; Ono Out of Every Twenty-Two Inhabitants in Canada Owns An Automobile

By T. M. McGREGOR, Vice-President and Treasurer Ford Motor Co. of Canada

DURING THE past decade a revolution has taken place in transportation. The motor car, truck and bus have entered into active competition with the trolley and interurban electric system and are seriously encroaching on steam line business for short haul freights. In these few years the automotive industry has bounded from comparative insignificance to a position of paramount importance.

In 1910 there were 8,937 automobiles registered in Canada. In 1920 there were 403,000.

In 1910 the total capital invested in the industry was $4,699,000, with a value in products estimated at $6,252,000. In 1920 these figures were, respectively, $56,943,000 and $101.196.000. These totals spell employment directly for 12,500 people with an annual payroll of over $15,500,000. Indirectly, the amount of employment provided will more than double this figure. These data can be divided approximately as follows: Automobile plants, 7,000 employes with payroll of $9,700,000; automotive supply plants, 1,800 employes with payroll of $2,000,000; automotive repair plants, 3,700 employes with payroll of $3,800,000.

The industry is wide spread. Cars are manufactured and assembled at Toronto. Oshawa, Walkerville, Windsor, Ford, Kitchener, Chatham, London, Hamilton, Brockville, Montreal and Winnipeg.

No estimate has been made of the army of salesmen, mechanics, repairmen, clerks and canvassers engaged in the service, sale and distribution of automotive vehicles, but some indication is given by the fact that there are over 1,600 automobile dealers in Canada, 500 automotive equipment and accessory jobbers and dealers, besides many tire manufacturers.

The industry pays taxes to municipality, province and Dominion involving purchaser, dealer and manufacturer. On license alone over $4,000,000 was paid in 1920, to which must be added business profits tax, income tax and provincial, local and other charges.

One in twenty-two people in Canada owns a motor car and it is enlightening to note how many cars are brought for business rather than for pleasure. Our company which keeps an accurate analysis of sales, reports the following after classifying 57,185 consecutive purchases of cars:

	Per Cent. of Purchasers
Agents	5.93
Agricultural	45.05
Government	1.68
Manufacturers	3.65
Jobbers	2.91
Retail Merchants	13.77
Public Service Corporations	.52
Transportation	4.18
Public Institutions	.14
Trades	5.53
Total Commercial Purchasers	83.36
Professional, Private and Sundry	16 64
	100.

Canada's part in the automotive industry by no means ends with production for domestic purposes. She is beginning to be one of the great automobile export nations. Department of Trade and Commerce figures for 1920 show the following export shipment values:

Autos—Freight	$ 2,602,853
Autos—Passenger	11,376,268
Autos—Parts	4,262,325
Total Auto Exports	$ 18,241,446

Export figures for 1910 are unavailable, as at that time no separation was made between gas engines, steam tractors and automobiles.

Canada's greatest opportunity for development lies in improved transportation. The automobile, truck and bus bid fair to solve the problem; and judging from the growth of the industry during the past ten years her people have not been slow to grasp the opportunity.

CANADIAN FORESTS SHOULD BE PROPERLY SAFEGUARDED

Canada's Pulp and Paper Industry Growing Rapidly—Industry Ranks First in Exports and Second in Capitalization

By W. H. CRABTREE, President Howard Smith Paper Mills

PAPER-MAKING began in Canada in the Province of Quebec about one hundred and twenty years ago, but for a period of forty or more years little or no development appears to have taken place. The industry apparently received some impetus between the years 1840 and 1867, when several small mills were erected in both Lower and Upper Canada.

It was about this date when pulpwood was first used in this country as a raw material in the manufacture of paper, and from this time the progress of the industry has been steady and constant. In the year 1891 some twenty small mills were in operation, with a total capital investment of less than three million dollars. At the close of the year 1920 there were about one hundred pulp and paper mills in operation throughout the country, representing a total capital investment of over three hundred million dollars, and giving employment to some fifty thousand persons in mills and woods.

The industry ranks first in exports, second in capitalization and is making a fair bid to become Canada's leading industry.

It is estimated Canada's forest area is capable of yielding over one billion cords of pulpwood, while the present rate of consumption is approximately two and one-half million cords annually.

Vast, however, as these timber resources appear to be, it is imperative that some definite steps be taken to safeguard our forests. To my mind, rigid regulations should be passed by the Provincial Governments and machinery set up to enforce the same. These regulations should provide for forest protection against: (a) fire; (b) destruction of the timber by worms or other species of insect; (c) improper cutting, and (d) depletion.

It is true there are certain restrictions and regulations in the statute books. These are not, however, enforced in anything like the degree that is necessary if we are to keep front rank in the pulp and paper industry, and I cannot urge upon our Provincial Governments too strongly the vital necessity for the enforcement of such restrictions. Wise legislation, well enforced, in co-operation with the limit holders, will ensure for Canada a supply of raw material for generations to come.

Our exports, which in the past thirty years have been built up from nothing to the amount of about one hundred million dollars per annum, can be greatly increased, and the increase maintained, but at the present rate of consumption and destruction we are surely running our heads against a stone wall. I feel greatly alarmed concerning the position of the industry twenty years hence. We have a golden ball in our hands. Do not let us throw it away.

Not only has Canada built up a tremendous trade in the

making of newsprint paper, but she has also made for herself a very enviable reputation for the making of high-grade writing and ledger papers, considerable tonnage of which is being exported to all parts of the world. This branch of the industry, however, is unfortunately handicapped, inasmuch as its growth is limited, very largely due to the fact that Canadian publications (other than newspapers) cannot compete with the United States publications that are now flooding this country. That some protection should be given to Canadian publishers is self-evident. Consider the tremendous influence that would be at work if our people were reading Canadian literature, presenting Canadian views from a Canadian standpoint. The development of our country would be along rapid, safe and sound lines, and not only result in the promoting of this branch of the paper industry in Canada, but Canadian industry generally.

MINERAL INDUSTRY DURING THE LAST TEN YEARS

Has Been Carried on Under Remarkably Abnormal Conditions—Nickel Industry Fluctuated—Asbestos Production Increased

By WYATT MALCOLM, Chief of Division of Geological Information

THE HISTORY of mining in Canada during the last ten years is the history of an industry carried on during most of the time under remarkably abnormal conditions.

Prior to the war there was a long period of steady growth of the mineral industry. This was, of course, affected by temporary depressions such as came in 1914. For a short time after the outbreak of the great war with its terrible disruption of established industrial and trade relationships there was a slackening in mining operations. When, however, it became manifest that the struggle was to be one of long duration and that an unprecedented demand for such metals as iron, nickel, copper, lead and zinc would assert itself, great energy was thrown into mining operations and the value of the production increased from $128,863,075 in 1914 to $211,301,897 in 1918.

With the close of the war came a cessation of the abnormal demand, and activities declined. The great world reaction, however, that followed shortly after the signing of the armistice and spent itself in a wild orgy of luxury and extravagance gave a powerful, though shortlived, stimulus to mining, and the value of the production reached its maximum in 1920 when it amounted to $217,775,080.

The general industrial depression that the winds of circumstance drove to every corner of the world in 1920 struck the mineral industry of Canada and led to the discontinuance of operations in certain quarters, and to marked curtailment in others.

The Nickel Industry

The nickel industry presents one of the most striking examples of fluctuation under the abnormal conditions. During the war the production of the Sudbury district, which supplies over three-quarters of the world's requirements, rapidly increased. To meet the insistent demand a new smelter was erected and two refineries were built in Canada. At the present time mining and smelting operations are greatly reduced and the Canadian refineries are closed.

The last ten years have seen the exhaustion of certain large copper deposits of southern British Columbia and the development and exploitation of others.

The mineral possibilities of Manitoba have attracted attention in recent years. Shipments of copper have been made and a large copper deposit awaits better transportation facilities for its development.

The famous Cobalt silver mines after reaching their maximum production of 31,039,104 ounces in 1911 have shown a gradual falling off, although temporary stimulus was given the industry by the high price of silver that prevailed for some time in 1919 and 1920.

A considerable increase in asbestos production was made during the war.

There has not been the same fluctuation in the production of coal as in the case of some other minerals. Alberta's mines have increased their output and contest with those of Nova Scotia for first place in production.

Certain minerals assumed unusual importance during the war; molybdenite mining sprang up, grew, and died out; the production of magnesite grew to considerable proportions; the production of pyrite made a marked increase and has since declined.

The mining of gold presents one of the most hopeful features of the industry. Recent declines in the cost of supplies, the abundance of skilled mine labor available, and the increased efficiency of labor have led to an increase in mining operations, and Porcupine gold district, one of the most important of the world, is passing through a period of greater activity than ever before.

The mineral industry in general is affected by the present industrial depression. There are, however, large reserves of ore in sight, and the return to normal and stable conditions is bound to bring with it a revival of mining.

OXY-ACETYLENE WELDING HAS MADE GREAT PROGRESS

By F. W. CARTER, President Carter Welding Co.

THE SUBJECT of welding metals by the Oxy-Acetylene process is one of paramount importance to all machinists, those interested in machinery, and those who employ machinery in their operations to any extent. Its history is so well known at the present time that it will suffice to touch briefly on some of the outstanding points. The fact that oxygen and acetylene when combined and ignited would under pressure produce an immediate heat of 6,300 deg. fahr., was first discovered by a French scientist, Fouchè, in the early part of this century. It was used in laboratory practice to a certain extent but was not employed commercially until 1906, and in 1907 was introduced into the United States where its possibilities were appreciated and it came into use extensively.

At first its use was practically confined to repairs of broken parts, but as was to be expected in this age of experiment, it was found that its ramifications were practically unlimited and it is to-day being employed by manufacturers as a most valuable adjunct in the manufacture of steel cars, steel barrels, metal sash and frames and aluminum ware — in fact, the number of industries which benefit by the use of oxy-acetylene welding are so numerous that it would be impossible to attempt to give them in detail.

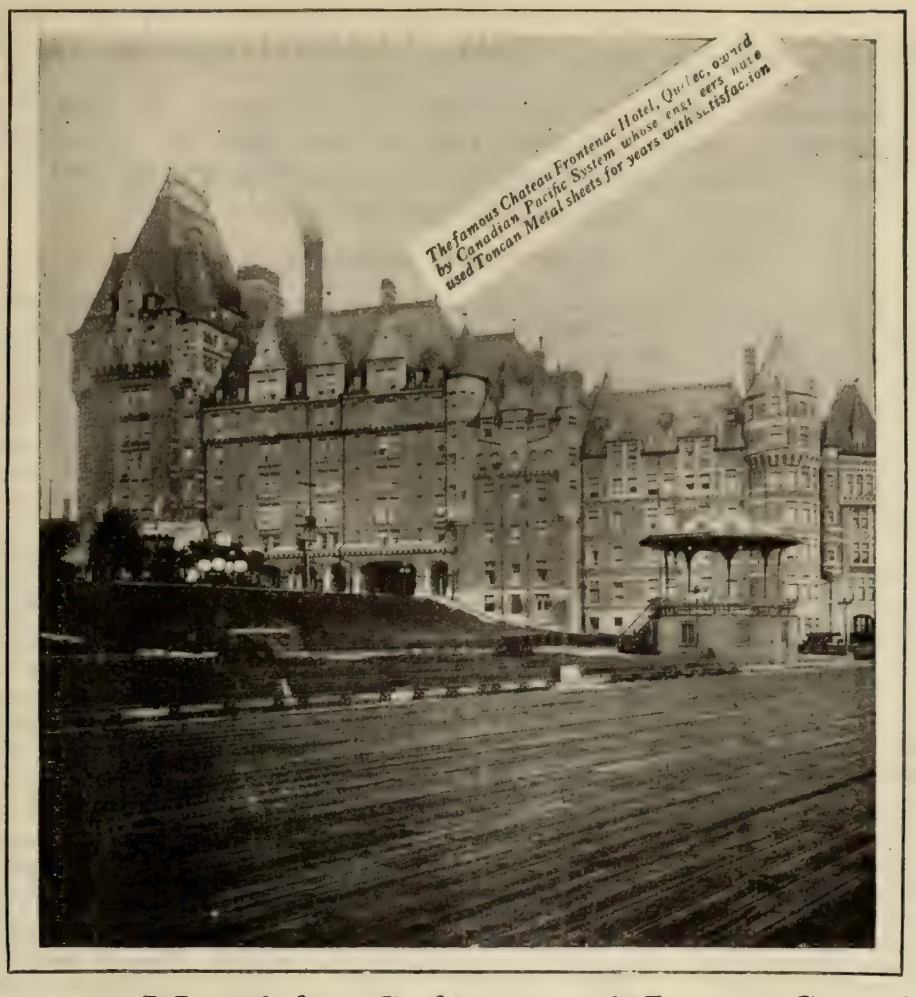
The rapid strides which this process has made since its introduction into North America have been so enormous that it is hard to find, either in the United States or Canada, an up-to-date machine shop, metal-working concern, mine, garage or similar business which does not include an oxy-acetylene welding and cutting apparatus as one of the most important elements of its equipment. In fact, a firm of that character which does not possess one is not in a position to compete satisfactorily with one which makes use of the process. In order that some idea may be given as to the extent to which this process is used in this country it may be stated that our firm alone have completed over 60,000 successful welding jobs in aluminum, cast iron, brass, steel and other metals during the twelve years they have been in business.

One of the most important uses to which oxy-acetylene welding has of recent years been adapted is the welding of high and low pressure pipe lines, two striking examples of which are the heating line of the General Motors plant at Oshawa and the high pressure steam line at the new Union Station at Toronto. The contract for these lines was undertaken and carried to a successful completion by the above mentioned firm at a great saving in time and money over the old method of screw joints and packed joints. Both of these lines were subjected to a hydrostatic pressure of 400 pounds and no leaks developed.

"ULOY" STEELS

With our immense plants we are in position to furnish all commercial analyses in open hearth and electric furnace steels. Rolled into bars, billets and slabs. Annealing, heat treating and cold drawing done according to your specifications.

There is a ULOY steel for each purpose. For automobile, truck and tractor parts; for ball bearings, axes, hatchets, wedges, agricultural implements, lumbermen's tools, track tools, shovels, picks, beater bars, coal crushers, piston rods, locomotive main and side rods, springs, shear knives—A few of these steels are:



Chrome-Vanadium	**Hi-Carbon**	**Magnet Steels**
Nickel	**Chrome-Nickel**	**Special**
Chrome-	**Silico-Manganese**	**Analyses**
Molybdenum	**Chrome-Carbon**	

What is **your** product? If an alloy steel can be used to advantage in its manufacture our engineers will be glad to assist you in the selection of the proper grade and type. Write, giving full details.

UNITED ALLOY STEEL

Open Hearth and Electric Furnace Alloy Steel for Railroads, Automobiles, Edged Tools and Agricultural Implements

If interested tear out this page and place with letters to be answered.

Toncan Metal for Safety and Long Service

Toncan Metal is anti-corrosive and, therefore, it was used for the roofing and flue work for the famous Chateau Frontenac Hotel, Quebec, because its long life makes it most economical. It has served here since 1915 and is still in excellent condition. Thousands of installations both in Canada and the United States testify to Toncan Metal's lasting qualities. Those made over twelve years ago are still good.

TONCAN METAL

The Iron that Endures and Insures

Where atmospheric conditions are severe specify anti-corrosive Toncan Metal. It endures. Also has superior forming and welding qualities. Write for complete information. A few well known uses for Toncan are:

Roofing	Cornices	Culverts
Siding	Skylights	Tanks
Eaves Trough	Window Frames	Lath
Conductor Pipe	Smoke Pipes	Refrigerators
Flashing	Water Pans	Washing Machines
Valleys	Ventilators	Enameled Products

CORP'N, CANTON, OHIO U.S.A.

In Canada: Toncan Metal is Galvanized by Dominion Sheet Metal Corp'n. Ltd., Hamilton, Ont., Fabricated by The Pedlar People Ltd., Oshawa, Ont.

If interested tear out this page and place with letters to be answered.

Development of British Machine Tool Industry

Progressive Design Policy With a Continuance of Traditional Quality Has Been Followed Out — Gear Machinery Has Made Rapid Strides—Also Grinding Machines, Automatics and Other Lines of Tool Equipment.

BY W. L. FISHER, Editor Engineering Production

IT WAS customary a dozen years or so ago, to think of the British machine tool trade as being a little old-fashioned. That is to say, it was admitted that British machine tools were fine, solid appliances, embodying as a rule irreproachable material and labour, yet it was considered that they suffered somewhat from the draw-back of crudity in design. Such tools, whether lathes, shapers or what not, were regarded more with respect than admiration by progressive manufacturing engineers, and go-ahead firms desirous of entering upon competitive repetition manufacture on an interchangeable basis, invariably went to America for a good deal of their shop equipment. In the finer precision work and the equipment of the tool room, many German products were pre-eminent.

All this has now changed. The products of British machine tool makers cover every conceivable requirement. Further, these machines are as good and in some cases much better than those of their corresponding foreign rivals. Whatever a manufacturer's requirements be, these can be satisfactorily met by machine tools of British design and manufacture.

In equipment for gear production especially, and also in grinding machinery, vast strides have been made, and the same applies to a lesser degree to precision lathes and tool-room equipment. In turret lathes, automatics and plain centre lathes, there are excellent British machines, and among those who know, it is generally agreed that development generally has been little short of remarkable.

The Post-War Situation

While much of this progress has been due to the war, the war has, however, been not altogether an unmixed blessing to the British machine tool trade. While it enabled and even forced progress, and many quite small firms found it possible to develop to a large and stable basis, the end of hostilities unfortunately left the industry with an appalling situation to face. Firms found themselves with vastly increased establishments but with their markets gone, not only gone temporarily but for some years ahead.

What means will be adopted by the industry as a whole satisfactorily to extricate itself from such a position remains to be seen. That drastic methods will be resorted to there is very little doubt. There will certainly be reduced establishments and outputs, and economical combinations of makers to eliminate waste competitive effort. In any case, whatever takes place the British machine tool industry is, of course, too big a thing to go under and its leaders too alert to sacrifice any of the traditional quality, either of material or workmanship. They are also thoroughly alive to the ever-changing character of modern engineering manufacture, and there is no doubt that the excellent design of to-day will be kept up to date to the very last hour of modern requirements.

Question of Design

Machine tool design, of course, reflects manufacturing conditions. The United States were of necessity pioneers in the automatic and semi-automatic fields, because they had, in the main, to carry out their manufacture by unskilled or semi-skilled labour, making the very best use of what skilled labour there was available. This led to the employing of the really skilled worker chiefly on the making of tools and the setting up of machines to be run by semi, or unskilled labour.

Various factors have tended to bring British engineering manufacturing conditions more and more into line with the intensive production of other countries, so that British engineering generally, will we hope be able wholly to support the modern and complete machine tool industry that we now have with us.

Detail Development

Regarding the detail development of British machine tool design, a very extensive change has taken place. The British tool of to-day has undergone a complete metamorphosis, and like its competitors, its very shape or contours are quite different from forerunning designs. Individual parts are of an improved formation, making for a better balanced structure, free from dirt-gathering nooks and corners, and the box section casting with all structural webs on the inside is the general rule. A smooth external appearance, free from sharp corners, is another characteristic, and metal is more carefully disposed, so that a correct degree of strength and rigidity is secured. Machines are now built to stand heavy cuts at high speeds, and this has greatly influenced headstock design, where bearings are of increased size. The old cone pulley has been almost entirely replaced by all-geared heads.

Grinding Machines

In grinding machines, much the same applies, and extreme accuracy, with capacity for running at very high speeds is combined in an exceptionally rigid structure. Simplicity and centralisation of control is a principle generally applied to all machine tools, and gear boxes are also a general feature. The dimensions of slides and ways are more liberal, and it is customary to guard these from chips and grit, and in some cases to fit them with oil covers. British grinding machinery has undoubtedly advanced tremendously, and there is little doubt that in this particular sphere the British tool is pre-eminent the world over.

Automatics have considerably advanced in design, and in this field there have been many interesting departures. Presses have also developed, and British turret and combination turret lathes are now generally admitted to be of a very high order indeed.

In gear cutting machinery there are many unique designs of British origin. It is in fact in this class of work that greatest progress has been made. This applies not only to machines used for the cutting progress, but also to the subsequent grinding after hardening process, which is now accurately and economically carried out on equipment of British design and manufacture.

Gear shapers of the generating type of British origin are now a feature of the industry, both for helical spur and helical bevel manufacture. One type of machine, developed for the production of gears of large size, cuts double helical wheels with both sets of teeth united in the solid at the apex, and without tool clearance. Altogether, a brilliant and unique record of achievement stands to the credit of British brains in this work.

Shapers and many small auxiliary machines of British manufacture are now of an excellent grade, and forging machines and equipment have also undergone marked development. There are some excellent British foundry moulding machines.

Much of the development that has taken place has been due to the formation of the Associated British Machine Tool Makers Ltd., under the auspices of which many of the leading machine tool firms have co-operated to form a logical manufacturing policy. Broadly this consists in allocating the manufacture of some single machine type to a certain firm. In this way they are enabled to specialize on a single product with really excellent results. Further, much wasteful competition is eliminated, and the development of each individual type of machine tool is much speeded up.

In general then, it may be said that while the character of the products of this industry is pre-eminent, the commercial situation is serious, and anything therefore that Overseas engineers can do to assist the flow of business to the Mother Country, will be appreciated.

Development of Toronto Telephone System

Telephone Was Invented in Brantford—First Sound Heard in 1875 — Many Important Developments Have Taken Place — Toronto Alone Has Over 100,000 Phones.

By FRANK KENNEDY
Toronto Manager Bell Telephone Co., of Canada

WHO was the inventor of the Telephone? where and when was it invented? The answer to these questions is liable to provoke a spirited controversy, especially if the discussion happens to be between a citizen of the United States and a Canadian.

The invention of the Telephone has perhaps done more than anything else to change the world in its business relationships, its social intercourse, and in welding together the different units of the great human family, and naturally it is a matter of pride to be able to claim the inventor as a member of any one country. We in Canada have that honor and so that this point may be clear let me say I have the personal assurance of the inventor—Dr. Alexander Graham Bell, that the Telephone was invented in Brantford, Ontario.

The first sound was heard June 2nd, 1875; the first sentence was transmitted March 1876, and on the inventor's 29th birthday—March 1876—the Telephone was patented. In 1878 the Toronto Telephone Despatch Co., (with a $3000.00 capital, 60 shares at $50.00 fully paid up) was organized by—Chas. Potter, Mrs. Chas. Potter, Melville M. Rosebrugh, Dr. A. M. Rosebrugh, and Hugh Neilson.

The company's business was that of installing private lines and the first installation was a line from the office of the late Sir Oliver Mowat, Simcoe and Wellington Sts., to his office in the old parliament buildings, Simcoe and Front Sts. Late in the same year (1878) the company placed in operation an exchange switchboard, residences of officials in the company only were connected at first.

In following the evolution of the telephone service it is very interesting to note that the first contract signed for commercial service was received early in 1879 from McGaw and Winnett, Queen's Hotel, Front St. West, present site, and Mr. Winnett, the present proprietor of the hotel, has the unique distinction of being a continuous subscriber during the time the system has developed from one to 100,000 telephones in Toronto.

Six Speak at Once

The exchange was located at 10 King St. East, upstairs, and the ground floor was occupied by a wholesale stationery establishment. Party lines with eight and ten subscribers on a circuit were used principally. The type of switchboard was manufactured by Davis & Watts of Baltimore, and as far as I can learn they were the first to take up the manufacturing of telephone switchboards. The board had six circles each with a dozen buttons and a dial or arm which would be turned to make connection with the desired button or subscriber; only three connections could be made at once, or in other words only six people in Toronto could be speaking at the same time. Push button battery bells were used for signalling.

Later another board known as the "Jones Switch" and manufactured I think in Cincinnati was used for individual lines, and on this connections were made by means of plugs. Ringing was done by a foot pedal in much the same manner that you would operate a a grind stone. The total number of employees was four—H. Neilson, M. M. Rosebrugh, A. Stark, and a boy or man for night operating as a twenty four hour service was given. In April 1879 the company had but 40 subscribers.

No long distance or out of town service was given until October 1881 when the line to Hamilton was opened. The rate for a party line was $24.00 per annum. Hand telephones only were furnished. It was somewhat similar to the present receiver you hold to your ear. You would speak into it, and then transfer it to your ear to receive reply. If two hand telephones were furnished to avoid this transferring from mouth to ear, the rate was $36.00 per annum.

In 1880 and 1881 rate for a separate line and Blake transmitter was $50.00 per annum per line ½ mile or under in length, and $5.00 per annum per ¼ mile was charged for distance beyond the ½ mile limit.

When the company was using the Blake transmitter the opposing interests used an Edison transmitter and as a result of the conflict in interest between these transmitters one of the greatest patent suits in history ensued and Bell's claim to the fundamental patent was upheld. The present Bell Telephone Company of Canada was formed in 1880 and absorbed the existing exchanges at Hamilton and elsewhere.

Late in 1881, or early in 1882, the exchange was moved from 10 King St. East, to the Mail Building, the number of subscribers at this time being 400. The operating room was about 20 ft x 12 ft. The Manager's office was located in the same flat in a room 12 ft x 12 ft. The Manager in those days did practically all the clerical work connected with the business. On May 24th, 1884, a fire occurred and subscribers now numbering 800 were deprived of service. A building was rented immediately on Bay St. approximately where the Molson's Bank now stands and a temporary service given. Subscribers were

This Telephone is a Duplicate of The First Instrument Through Which Speech Sounds were transmitted electrically in 1875.

One of The First Switchboards. Note That it Was Operated by Men

inconvenienced for only two or three days. The new board which was placed in the Mail Bldg. ofter the fire, was the first multiple type board installed in Canada.

On April 1st, 1886 a second fire took place in the Mail Bldg. and 1200 to 1500 subscribers were out of service from one to four months. Subscribers' lines in these days were single with grounded return and the introduction of electric street lighting and the electric street railway caused serious trouble on account of induction, and to remedy this it was necessary to change from single to metallic lines or in other words to use two lines in place of one thus doubling the wire mileage.

Multiple Metallic Switchboards

The business had grown rapidly. A new building was erected at 37 Temperance St., and in June 1894 the new multiple metallic switchboard with self restoring drops and other improvements over the old type was cut over and the staff moved from the Mail Bldg. The first North or Yorkville Office as it was known in 1883-1884 was located in a room about 15 ft x 12 ft. in a building at the corner of Yonge and Cumberland Sts. occupied by the Federal Bank.

In 1885 this office was moved to a building on the west side of Yonge, opposite Isabella, 1891, the location was changed to the corner of Yonge and Bloor, May 1902 to Hayden St. and Dec. 4th, 1911, to the present location, Asquith Avenue. Parkdale exchange was opened March 1890 at 1249 Queen West in a small room over a tailor's shop, and in 1912 was moved to the present site Cowan Ave. near Queen.

The business has expanded rapidly until at the present time we have eleven exchanges, the Adelaide building also housing the long distance department. The entire plant in Toronto could not be replaced for less than $16,000,000.00, and is operated by approximately 3200 employees. The development gives almost one telephone to every five persons in the City.

When you have a telephone installed in your office it gives you access to our entire plant which is valued at over $50,000,000.00. Should you have occasion to talk between Toronto and Montreal equipment to the value of $115,000.00 is in use exclusively by you, and the party to whom you are speaking.

If the cables or trunk lines connecting the eleven exchanges were connected in on continuous line it would reach 1.6 times around the earth at the equator. The following figures will I think give concisely the magnitude of the plant:

Number of telephones now, 100,000; miles of wire in service, 269,397; miles of wire underground, 222,668; percentage of wire underground, 83%; length of underground cable, 367 miles; length of streets occupied by conduit 121 miles; number of manholes, 1,271; number of 'phones on Jan. 31st, 1907, 18,944; number of 'phones on Jan. 31st, 1910, 28,154; number of 'phones on Jan. 31st, 1915, 57,304; number of daily calls, approximately 1,000,000; number of long distance calls daily 5,400; "Information" calls daily 9,745; busiest hour during day 10-11 a.m.; number of calls handled in that hour, 103,000; number of employees, 3,204; total yearly payroll, $3,706,858; number of operators, 2,200; number of trunk lines, 6,600; number of long distance circuits, 272; number of residence 'phones, 60,024; and number of business 'phones, 39,976.

It is estimated by our engineers that in 1927 we should have in operation 17 exchanges, and 180,000 telephones. We are glad to have anyone visit our buildings. They will always be welcome and we feel they will be amply rewarded by finding the visit most interesting and instructive.

NEW TYPE OF CONCRETE ROAD

A British road engineer has developed a new type of concrete road. He lays the concrete in alternate portions and does not fill the intervening spaces until the material in the first portions has set and contracted. Further, he makes the edges of each portion exactly vertical by means of special appliances. This new method results in the roadway being split up into straight close joints instead of a number of irregular cracks. When the coating of tar is applied it fills up these narrow joints, which act really as expansion joints. In actual practice the joints are not straight across the road but at an angle, in order to prevent the whole weight of a heavy load resting on the edge of one slab. Reinforcement is of course employed to strengthen the concrete, but in no case is it taken across the joints.

A new and somewhat novel tunneling machine has made its entry into the world of industry. It comprises a boring head and a rotating tail arrangement by means of which the lining is placed. Experiments have been made with it in Philadelphia.

A Modern Switchboard Operating Room

Developments in the Pulp and Paper Industry

This Industry Continues to Show Progress—Canada's Exports of Pulp and Paper Have Increased from $120 to $163,655,344 in Thirty Years—Paper Machinery and Methods Have Advanced

By EDWARD BECK
Secretary of Canadian Pulp and Paper Association

DESPITE temporary setbacks, due to the universal period of liquidation through which all industries are passing, the pulp and paper industry of Canada continues to show progress and development. Ranking second in point of the amount of its invested capital, third in the value of its products, the industry occupies first place among Canada's purely manufacturing exporting industries and will long continue as one of those to which the Dominion must look for growth in its external outgoing trade. It is in its export trade figures that the history of the growth of the industry is most readily traced. In three decades—from 1891 to 1921—Canada's exports of pulp and paper have increased in value from $120 to $163,655,344. To-day over 85 per cent. of the production is exported, and indications are that this proportion will increase.

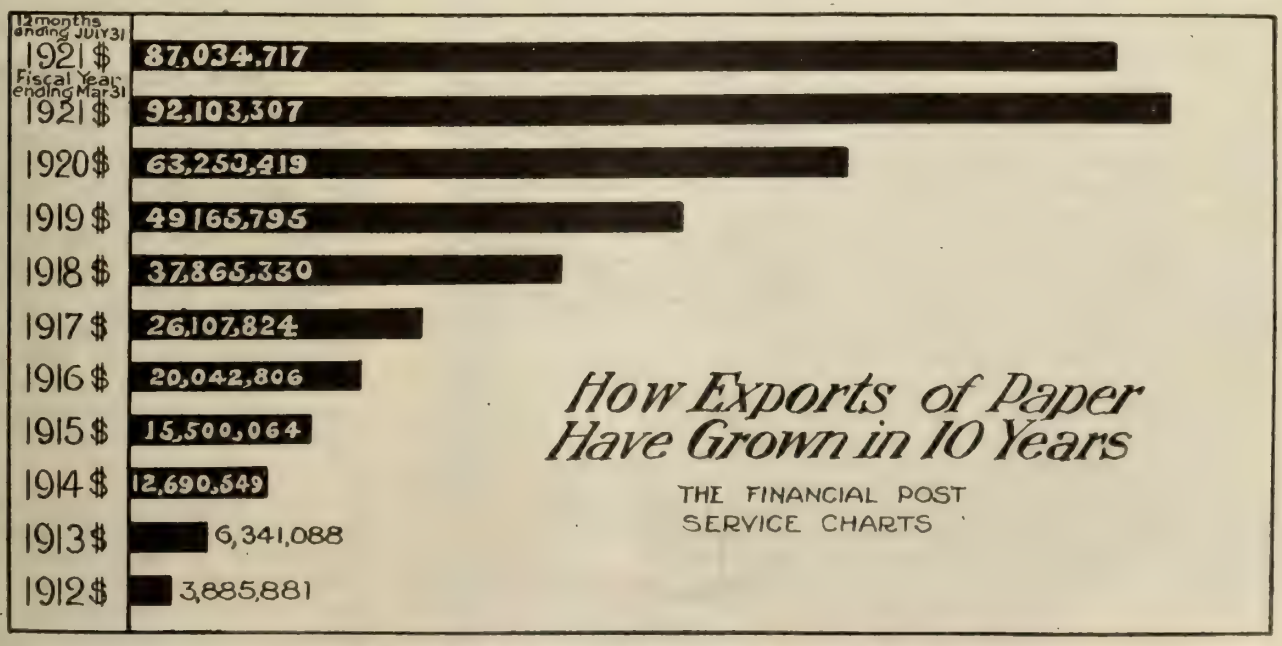
Striking as has been the increase during the last 30 years, the last decade shows also a rapid though steady progression as illustrated in the following table of exports of pulp and paper for Canadian fiscal years (April 1 to March 31) 1912 to 1921, inclusive:

	Paper & Mfg. of	Chem. Prep. Woodpulp	Mech. ground Woodpulp	Total
1912	$ 3,885,881	$ 1,587,533	$ 3,506,770	$ 8,980,184
1913	6,341,088	2,100,842	3,408,702	11,850,632
1914	12,690,549	2,923,083	3,441,741	19,055,373
1915	15,500,064	4,806,622	6,801,011	27,107,697
1916	20,042,806	4,459,539	3,575,537	28,077,877
1917	26,107,824	14,032,920	6,371,133	46,511,877
1918	37,865,330	19,133,813	6,487,079	63,486,222
1919	49,165,795	30,226,856	4,479,915	83,872,566
1920	63,253,419	32.998,500	8,383,419	104,635,338
1921	92,103,307	55,060,219	16,491,818	163,655,344

Last year these exports were distributed approximately as follows: United Kingdom 7.2 per cent.; United States 79.5 per cent.; other countries 13.3 per cent.

While the above figures include paper of all kinds and woodpulp, the largest development has had to do with the production of newsprint paper, which is used in the publication of newspapers and in other ways.

Mills in Operation



There are fifteen newsprint mills in operation in Canada at present, with a total daily capacity of 3,412 tons or just over 1,000,000 tons a year. When it is considered that United States mills, in 1920, produced a total of merely 1,511,000 tons, an idea may be formed as to the growing importance of this branch of the industry to Canada.

Of the daily capacity of 3412 tons, 525 tons (or 157,500 tons annually) represent the product of new machines installed during the last year. During 1922, when extensions, now in progress, are completed, the daily capacity will be further increased by 240 tons, making the total yearly capacity of Canadian newsprint mills in 1922, 1,095,600 tons.

The largest market for Canadian newsprint is the United States. Owing to growing scarcity and increased demand in that country the U. S. Government in 1911 removed the duty on all paper valued at 5 cents per pound or less (the limit has since been placed at 8 cents) this action opened a large market to Canadian made paper.

In 1908, and the following two years, the Provinces of Ontario, Quebec and New Brunswick adopted, as a measure of self-protection, and to encourage home industry, regulations requiring that all pulpwood cut on the Crown lands of their respective Provinces must be manufactured into pulp or paper in Canada. This helped considerably to stimulate the industry and resulted in bringing United States manufacturers to Canada to erect mills for the purpose of converting into pulp and paper the wood they could no longer export.

Another means of tracing the growth

Graph Showing How Exports of Paper Have Increased Since 1912.

of the industry in Canada will be found in the successive census returns published by the Dominion Government.

In 1881 there were five mills in operation, capitalized at $92,000 employing 68 persons, with an annual production valued at $63,000. In 1891 there were 24 establishments, with a capital of $2,900,907, 1025 employees, and production valued at $1,057,510. In 1901 there were 25 mills in operation, capitalized at $11,558,560, employing 3,301 persons and turning out products valued at $4,246,781. In 1919, the latest census figures obtainable, there were 99 mills in operation, 33 of which manufactured paper only, 39 pulp and 27 both pulp and paper. Capital employed amounted to $246,581,300, distributed among the Provinces as follows:—

Quebec $124,101,164; Ontario $95,281,040; British Columbia $32,030,063; New Brunswick $11,960,778; Novia Scotia $1,208,255. Employees numbered 25,491, exclusive of woodsmen, and salaries and wages paid amounted to $32,323,789. Production was valued at $139,925,001.

The items of production were:

Pulp for sale.	Tons	Value	
Groundwood	300,205	$ 8,976,579	
Soda fibre	3,174	297,113	
Sulphite fibre, bleached	100,132	9,425,836	
Sulphite fibre, unbleached	263,866	19,885,590	
Sulphite fibre	124,550	9,839,172	
Other products		137,798	$ 48,562,088
Paper	**Tons**	**Value**	
Newsprint	794,567	54,427,879	
Book and Writing	58,228	12,571,000	
Wrapping	58,697	7,979,418	
Boards	137,678	8,892,046	
Other papers	40,065	3,882,500	
All other products		3,610,070	$ 91,362,913
		Total,	$139,925,001

The number of mills operating in Canada to-day exceeds one hundred. Authentic estimates of the capital invested place the amount at between three hundred and three hundred and fifty million dollars.

Advance in Methods and Machines

A big advance has been made in paper mill machinery as well as in manufacturing methods since the early days. In 1858 the height of efficiency in papermaking was thought to have been reached when a machine was installed at Georgetown, Ont., capable of running at the rate of 100 feet a minute. To-day the machines run at the rate of 600 to 1,000 feet a minute. Two of the new machines installed last year by the Abitibi Power and Paper company at Iroquois Falls, for the manufacture of newsprint, are the largest in the world. They are 232 inches wide and each is capable of turning out a sheet of newsprint paper over 18 feet wide and about 200 miles long every working day, or approximately 85 tons. Two new 166-inch machines in the Laurentide mill at Grand Mere turn out newsprint paper at the speed of over 1,000 feet a minute. They are generally regarded as being the last word in newsprint machines and were made in Canada.

In the early days rags were principally used in the making of paper. Woodpulp is said to have been first used by the papermakers of Europe and America, about the year 1860, but it was not until some time later that its use had become commercially successful. Finally after numerous experiments the chemist discovered that spruce and balsam were most suitable for the production of ideal cheap paper. This discovery led to Canada's predominance as a paper-producing country.

Many estimate, more or less authentic, have been made in Canada's pulpwood resources. The latest and probably the most reliable, gives a total of actually available spruce and balsam, after making all necessary reductions, of, roughly speaking, 306,000,000 cords of wood in Quebec, New Brunswick, Ontario and Nova Scotia with a possible addition of some 38,000,000 cords in the case of Ontario, dependent upon railroad development to make it available. Divided by provinces this estimate gives:—

Quebec	155,000,000 cords
New Brunswick	26,000,000 cords
Ontario	100,000,000 cords
Nova Scotia	25,000,000 cords
Total	306,000,000 cords

The same authority estimates Western Canada's pulpwood supplies at 340,000,000 cords; 255,000,000 in British Columbia and 85,000,000 cords in the Prairie Provinces.

This gives a grand total of 646,000,000 cords of more or less commercially obtainable pulpwood in the Dominion.

The present consumption of pulpwood is approximately two and one half million cords per year and an additional million cords are exported. As the consumption increases it is realized that the supply is not inexhaustible and some of the Provinces, as well as several of the manufacturers, are wisely engaged in extensive afforestation operations with a view to ensuring a permanent supply of wood.

Next to an adequate supply of accessible pulpwood the industry depends, for its successful operation, upon the possession of suitable water powers, commercially available and capable of economical development. Fortunately Canada is richly endowed in this respect, having the second largest hydraulic resources of any country in the world. It is estimated that our water power is roughly seventeen million horsepower, of which only about two million h.p. is developed. Eliminating five million h.p. located in inaccessible places or existing in small units, there remains approximately ten million h.p. yet capable of development. Of the present total water wheel and turbine power developed, 473,265 h.p. are used to operate pulp and paper mills.

When the picture is drawn of the current year's pulp and paper production and exports it will, probably for the first time, show a backward trend. This, however, is clearly a temporary condition. The industry must of necessity prosper or decline according as business in general shows inflation or deflation. The fall of 1919 witnessed a tremendous boom in advertising which kept up well into 1920 but in the latter part of that year, due to the general depression in business, the falling off was noticeable and has continued largely up to the present. There is no feeling of pessimism, on the contrary, confidence that the danger point has been passed is apparent. New uses are constantly being discovered to which paper may be put; the mills are wherever possible increasing the efficiency of their machinery and reducing operating costs, and as business in general gradually emerges from its present depression, the Canadian manufacturer of pulp and paper, with his plentiful supply of pulpwood and water power, has nothing to fear for the future of the industry either from foreign competition or other causes.

NEW AIR SERVICE

In spite of the difficulties which surround the development of a novel form of transport, the regular aeroplane service organized in Great Britain continues to expand. In the near future an additional service between London and Paris will be started. It is intended to arrange four regular services each way per day. These services will involve some portion of the journey being made in darkness. Improved lighting arrangements have been introduced at the aerodrome in order to enable night flying to be carried on in safety.

Ontario often prides itself with cause over its hydro electric development. Few citizens are aware perhaps that in 1920 Swedish hydro electric stations were developing 1,200,000 horse power. Equipment since added has brought the total close to 1,500,000 horse power.

Development of the Machine Tool Industry

The Engineer and Mechanic Are Chiefly Responsible for the Development of Machine Tools—Their Co-operation and Mechanical Ability Has Helped Us in Many Ways

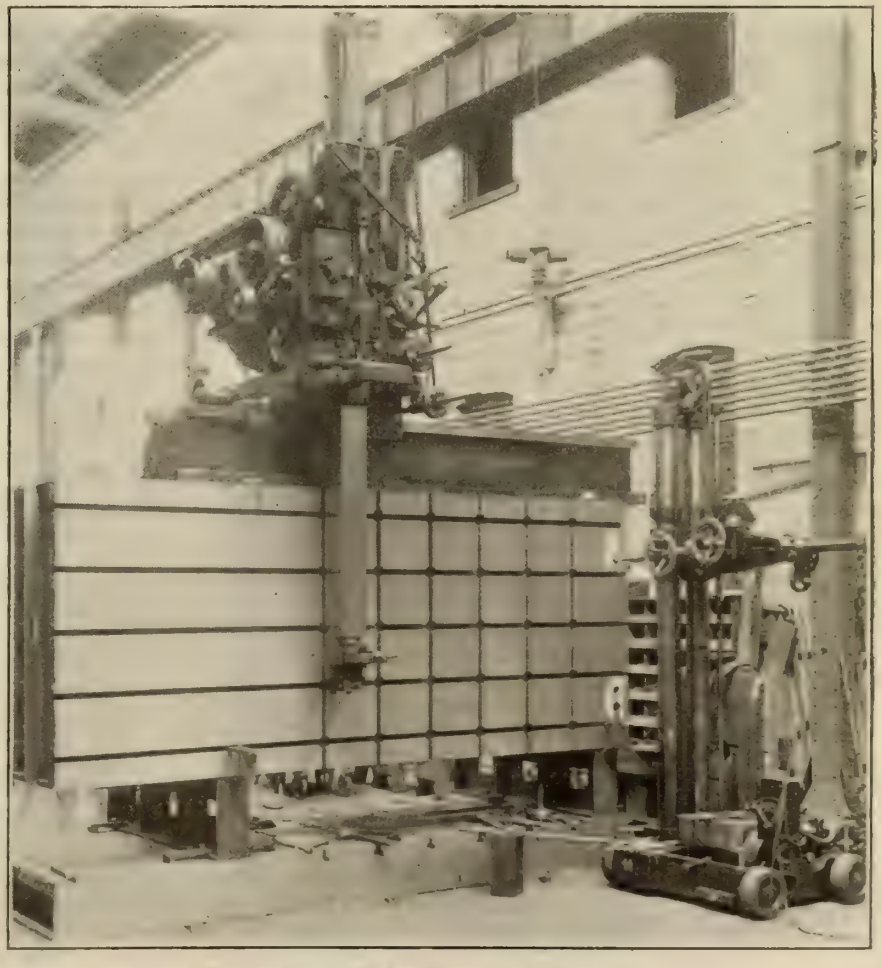
By GENERAL, SIR ALEXANDER BERTRAM, of John Bertram & Sons Co.

THE PROFESSION of the Mechanic and Engineer was scarcely known until the middle of the 17th Century, when the important discovery of the application of steam by James Watt and its rapid development, called into existence a new class of mechanics who gave fresh impetus to manufacturing, by improvements to all kinds of machinery.

The ancients knew the principles of the inclined plane, the wedge and the screw and were able to move vast weights, but the improvements made in machinery in modern times, have enabled us to execute work of vast magnitude with a great saving of manual labor. In those days men were individualists and made things by hand. Man was proud of his work. Thus up to the end of the 17th century very little progress had been made in manufacture. The crudity of machine shop equipment as existed in those days can be contrasted with what is being accomplished today.

The progress in constructive engineering is always closely connected with the means of effecting improved work, and of these, the machine tool forms a most important feature. In order to carry on this development the mechanical engineer has brought forward three machine tools: viz., the turning lathe, iron planer and drilling machine. The principle of these three tools is worked into a great variety of machines.

In the year 1847 Edward Cresy published probably the first Encyclopedia of Civil Engineering and in this work he describes the above machines in detail. In the same year my father, the late John Bertram, was serving his apprenticeship with his uncle in Galashiels, Scotland, and on completion of his apprenticeship he married and sailed for Canada in 1852. He often related to the writer that when he was serving his apprenticeship he was compelled to drive the lathe by a hand wheel—the mechanic operated the machine by using a hand tool.



On his arrival in Canada, he, by the way, sailed on an Allan liner 450 tons and arrived in Montreal, sailing through the canals to Dundas, where he took a position with the late John Gartshore and there operated a New Haven lathe driven by belt and the saddle operated by a chain from one end of the bed to the other. There were no lead screws on lathes in those days, and one of the principal operations in this foundry was the making of stumping machine screws. The thread of the screw was pitched off by hand on the bar and the form of the thread chipped by hand, finally chased with a chasing tool. The brass nut was cast on the screw when finished and afterwards ground to a fit. My father's ability as a mechanic and engineer became famous throughout this part of the country, and in the year 1861 he joined partnership with the late Robert McKechnie, and afterwards completed probably the first modern turning lathe built in Canada, which was exhibited in Hamilton, Ont.

I wish to picture to the mind of the mechanic that this all took place 65 years ago when he developed the first lathe with a screw on the back of the bed for screw cutting, and the rod with a spline on the front of the bed for the purpose of turning, you can at once see that a great improvement had been made in the machine tool, and the responsibility of all these improvements lay with the mechanic. Too little credit is given the mechanic by the outside world for the great part he has taken in the improvement of machine tools and the production of machinery.

By the introduction of electricity and the development of high speed steel, wonderful changes have been necessitated in the strength and speed of these tools. The mechanic has been able to expand his sphere of operations to a much greater magnitude with results as shown in our wonderful Navy, which defended the World against the enemy, our railroad transportation, the development of hydraulic machinery to enable us to harness all our water powers throughout the country, the production of the Aeroplane and the many wonderful mechanical inventions of recent date.

His splendid co-operation and mechanical genius played no small part during the late war which enabled us to accomplish wonders in Canada where we outstripped the world in the production of munitions. His ingenuity at that time was recognized by everyone who came in contact with details of production.

A great future is before the mechanical engineer where by a thorough education and the development of his ability he will be able to further expand his sphere of operations as shown by his good work in the past.

More People and Capital Needed

THE MOST casual student of public affairs can scarcely reflect on general conditions in Canada without concluding that more population and capital are two primary essentials, if resources are to be developed and heavy national debts liquidated. Whoever casts his eye ahead into the next year will see eight and a half millions of people carrying a financial load out of all proportion to the shoulders on which it rests. He will notice big railway deficits, in the past reaching a total of roughly $11,000,000 on the national lines in 1919 and 1920, inclusive of course, of operating and fixed charges. It is gratifying indeed to learn that these deficits are now being reduced month after month. He will find hundreds of millions of pressing debt, assumed for war purposes, which must be either paid as the loans fall due or be carried on by renewals, with big interest charges. At the same time he will observe that there are vast agricultural, mineral, forest and power potentialities still idle for want of brawn and sinew to develop them.

It must indeed be obvious that some progressive policy will soon have to be put into operation under which a desirable class of immigrants will be brought to the Dominion. Far flung arable tracks, embracing thousands of acres of fertile land, should not be left unsettled, when congested Europe is panting for breath and yearning for new opportunities amid healthy social conditions. It is a moral as well as an economic need that the scales of humanity should be better balanced.

That caution should be practised in selection, that methods of assimilation and nationalization should be sound and effective, are unquestioned. No one would advise indiscrimate action, but at the same time no tide can ever flow without of course being attended by some disadvantages. Agriculture is a basic industry, particularly in a country with such expansive borders as those of Canada. It is unlimited in its possibilities, but before the many millions of acres can be made to produce they must be peopled. Capital has a habit of following the tide of population, when that tide is directed toward productive pursuits, and if one could visualize three or even six millions more people scattered over the farm lands of the Dominion he would also see several more millions of money coming into this country, not alone for development purposes but in exchange for the agricultural products which Canada could export.

If indeed there be any avenue of escape for citizens of the Dominion from large railway deficits, high freight and passenger rates, burdensome public debts, and other financial ills, it lies in the direction of a time when they will have a few million more people to help them produce and consume, to buy and sell, to import and export, to ship and to travel, to create markets and promote greater national wealth. The small number of 148,477 immigrants who came to our shores during the last fiscal year, ending March 31st, 1921, is a mere handful of what could be absorbed and converted into wealth if a broad and progressive scheme were devised and carried out for the settlement of thousands of families on the land.

The Busy Bee Makes the Honey

TO ITS readers everywhere the annual number of Canadian Machinery goes out, not only as a comprehensive review of conditions as they have existed for the past twelve months, but with a distinctive tone of optimism for those to come. Indeed the New Year upon which we are to enter has much more to recommend it when it is introduced as a new opportunity, as a period which promises to open doors that have been closed and to bring with it some of the brightness of success rather than the gloom of industrial depression.

However unpromising the seasons have been through which business has been passing, to-morrow always brings possibilities that yesterday has carried away. Generally speaking, 1922 will be better than 1921 in proportion to the efforts pepole make to improve it. Trade, commerce and industry are strengthened, increased and extended by those who are aggressive. The busy bee makes the honey.

Canadian Machinery feels gratified over the co-operation of business firms in placing their goods before the buying public through its pages. It is by letting the world know what you have for sale that buyer and seller are brought together.

The year just closing has not been without anxiety and dullness. Markets have been slothful. Finance for many has been difficult, but nevertheless Christmastide was accompanied by widespread cheer and a hopeful horizon. We would like to have extended a personal greeting to every reader but as that was impossible we offer through these columns the hope that the immediate future will bring a better, stronger tone in the metal working industry in all its branches and for everyone engaged in it. Prosperity is often just around the corner from failure. The motto of every one engaged in business should be to go out and make the New Year put its best records on the right side of the ledger.

This annual review number is possible because there is a progressive element in business from coast to coast, an element in business which believes that little comes to those who sit down and wait, an element which wants the public to know what it has to offer in the mechanical field. We propose to look forward rather than backward, to achieve rather than rest. It is this spirit of action, of enterprise and of courage that we would like to pass on to subscribers and advertisers wherever they may be, along with the whole hearted wish that 1922 will be full of happiness and good fortune.

"Canada is better able to face the future than almost any other country in the world," said Sir Robert Kindersley, director of the Bank of England and Governor of the Hudson's Bay Company at a recent annual meeting of that corporation in London. There are few men outside Canada better able to speak on the business future of this country, for in addition to being one of the leaders in the commercial and financial life of Great Britain, he is head of a company that has been trading in Canada for over 250 years and has travelled it from end to end.

The Business Outlook for 1922

By Lt. Colonel J. B. Maclean

THE editor of Canadian Machinery tells me there is no subject in which his readers — executives, managers, superintendents, foremen and worth-while mechanics— are more interested than the business prospects for 1922. They are asking: to what extent can they keep their plants and employes working? Has liquidation run its course and are conditions improving?

To the first question I have no hesitation in answering that for those firms who would adapt themselves to present economic conditions the prospects are generally favorable for 1922 and improving in the years following.

To the second: a good many statements are appearing to the effect that not only have food and provision prices reached bottom but general costs and wages are there also, and a steady improvement is under way. But so far no man whose views command respect among experienced men has expressed any such opinion. Among men whose history shows their opinions are worth while, there is a very definite belief that general costs and wages must work lower and many think there will be no definite improvement for two or three years. It is true some big danger-breeding spots have been cleaned up. Financiers have co-operated more sympathetically than ever before with business, big and little. They, the financial institutions, have taken big losses. Hundreds of millions have been wiped out. One institution with world-wide connections has been helped to the extent of $120,000,000 and has itself taken a loss of over $50,000,000 cash. If that had not been done there would have been a great world-wide panic, bringing down thousands of old concerns and creating such widespread unemployment that would have taken years to repair.

No Ordinary Trade Depression

Canada is dependent largely on selling what we can outside the country; we are dependent upon foreign conditions. As one economist puts it: this is no ordinary trade depression but it has been partly brought about by bad politics and bad leadership designed to fool the public. They have created an entirely wrong impression among the masses throughout the world. They have forced the adoption of vicious policies and are preventing the carrying out of economic measures that would improve business and give employment. Mainly, they have kept costs of production up and prevented international war settlements. We cannot expect a real improvement until these problems are partially or wholly adjusted. The world owes Britain and the United States many billions of dollars. They cannot pay except in goods. To pay in goods means they must undersell British and United States manufacturers and producers. In accepting payment in this form, British and United States factories would have to close and there would be more unemployment. The efforts of Germans to sell goods to pay indemnities are already responsible for much unemployment in England and elsewhere. Men who are governed by experience and wisdom in these countries are advocating the cancellation of all war debts and the reduction of the German reparations. At present popular prejudices are so strong that Governments dare not propose any cancellations.

Canada has no debts worth mentioning to cancel, but as the United Kingdom and the United States are our two best customers we are very much interested in their prosperity. If business is bad, they will buy less of our products. France is our third, and Germany looks like our fourth best customer. Of course, there are other lesser factors but keep your eye on that world condition. It will help you to estimate the future of business.

Our internal conditions are distinctly more favorable. It is true that high costs of building and of manufactures and low prices of farm products, excessive taxation and the United States tariff, are still handicapping us. But they have recently been offset by two new factors: the change of Government, and the announcement that the C.P.R. proposed spending $20,000,000 to bring in 100,000 of the best type of British emigrants. There is perhaps a third—the announcement in The Financial Post by Mr. Fordney—the promoter of the tariff that hit Canadian farm products so hard—that he had inserted a clause specially to form the basis of a friendly exchange with Canada, looking to an increase of trade. Something may be done in this without injuring established Canadian industries.

Probably most of you were, like myself, supporters of the old Government until we realized they were like many a fine old firm. They had lost energy, initiative, enterprise. They were drying up. They were completely out of touch with their customers. They got a young general manager but held on to the big foremanships themselves. They had no life. They were out of date and refused to believe it. They would do nothing and prevented others from doing anything. You all know good old concerns like this that are gradually dropping out. The old Government ran their business inefficiently and taxed us more than any country in the world to pay for their waste. They brought us nothing in return. That is, their Minister of Trade developed no foreign busness for us. Nor in co-operation with the Minister of Labor did he help to bring down costs of living. The Minister of Immigration did nothing that you would notice in bringing in well-to-do immigrants who would be big buyers of your products for the next few years and new average buyers for all time. It is to immigration we must look chiefly in the immediate future for increased business. The new Government holds hope for improvement, but with the C.P.R., and its splendid business management, entering the field we have much to be thankful for.

Coming back to the first question, your own plant. There are some in first-class condition to-day. The majority are not. I believe the majority of this majority can greatly improve their position. It is possible for a lot of you to become great leaders in your industry. How? By following the methods of those who have been successful. You will find that, while differing in minor details, they followed exactly the same principles, viz., they put nearly all their waking hours into their work; they were economical but generous; they made the best product they knew how; they produced it at the lowest possible cost and then pushed the sales aggressively. They avoided getting into a rut as they grew older by gathering young men of the same type about them and listening to their advice on new developments.

I cannot name you two better examples of this type—the men whose careers can be studied and followed—than two very old friends of mine who recently passed out, John McClary, the great stove manufacturer of London, and Mr. McLaughlin, who built up the largest and best carriage business in Canada and switched five years ago—in co-operation with his sons—to the automobile industry.

Review of Hardware Quotations

Comparison Tables Indicate Readjustment of Values Still Continuing — Decline During Past Year Worthy of Particular Notice —Retail Merchants Prove Adaptable to New Business Conditions —Charts to Meet the Price Argument.

Written for Canadian Machinery by Hardware and Metal

ANY COMPARISON of prevailing quotations on hardware commodities with pre-war prices, indicates that the readjustment of values is still continuing to be a vital factor in the life of the hardware industry. This movement developed considerable momentum during 1921, and the extent of the decline in prices generally, has been more marked during the past year than at any time since the peak of inflation was registered.

The average price advance on hardware goods during the war and post-war periods, was much less in proportion when compared with some other lines. Hardware prices did not jump so rapidly, nor so high, but the increases were of a more gradual nature, reflecting the periodical tendencies of the basic markets. The degree of artificial inflation which was so apparent in prices on many commodities, was not evident in hardware goods to any marked extent. Just a few lines were forced exceptionally high; and this phase supplies an unusual factor tending to show a higher ratio on the average hardware price levels, than may be generally applicable. The usual advance was based upon solid reasons, such as higher costs of raw material; and chiefly because of this element which was noted during the period of price ascendancy, the urgency of deflation has not been so pronounced.

Lower Prices on Necessities

Another important factor in determining the trend of hardware quotations is found in the general classification of the majority of hardware lines as necessities. The rise in price was undoubtedly more apparent on luxuries, than any other class of goods. This reason is again of importance when considering the ratio and extent of decline during recent months. Although quotations on necessities did not soar to such dizzy altitudes, as did prices on luxuries, yet the former were the first class of commodities to attempt the return to pre-war standard values, and they have continued to lead the way in this respect. Hardware, both as a class, and also as regards to the majority of its numerous individual items, can be found in this category.

Price charts covering the past year, clearly indicate the startling ratio of decline in hardware commodities that has developed during 1921. Marked readjustment of this nature, is an exceptionally difficult period for all phases of industry. But the majority of hardware merchants have successfully weathered the storm. Failures among the retail branch of the trade have been exceptionally few, perhaps less than in any other branch of commerce.

This ability on the part of the hardware merchant generally, to become adaptable to changing business conditions, is attributed to the careful buying policy which has been adopted during the past few months, and also the manner in which the majority have closely followed the market trends. In some instances, smaller stocks have been carried, while the quicker turnover of stocks and more frequent purchasing have become accepted factors.

Diagrams or charts depicting price comparisons are usually spread over a period of years showing the movements to be gradually upwards or downwards, as the case may be. Various tables and charts compiled show that hardware prices have dropped during the last year to the same extent as several years inflation. In other words, prices in 1921 went back to the 1917 levels. And 1917 prices were not so far in advance of pre-war standards. It was towards the latter part of 1917 that hardware quotations commenced their upward climb; an ascendancy which continued during part of 1919 also, and throughout most of 1920. Of course, it must be remembered that such tables merely provide an average, and are not fully indicative of the various movements of individual lines. In many cases, prices are almost back again to 1914 levels. Others are merely temporarily prevented from further deflation owing to primary contributory causes such as freight rates; producing, operating and distributing costs. It is generally admitted that these latter factors are still much above pre-war levels, and such elements are naturally reflected in prevailing prices.

Adequate Comparison Available

Therefore, another consideration is suggested in the fact that price charts covering hardware goods would be even more illuminative if substantiated with similar charts or diagrams depicting the ratio of decline in such matters as transportation charges, and the cost of living. Adequate comparison is readily available, for personal experience in the subject of freight rates is a guiding force supported by fair memories and business records of easier freight costs. And likewise, both the merchant and the public are undoubtedly in an advantageous position to ably judge the extent of any relative decline in living costs that have recently developed.

These various matters, when fully considered, supply the retail merchant with a clear viewpoint of the prevailing price situation, and also many concise arguments whereby the viewpoint of the general public on these topics may be converted.

In 1918 the capital invested in thirty leading industries in Canada was $2,076,360,844. The value of exports was $2,311,831,449.

The Salmon Fisheries of British Columbia

Early Settlers Made Salmon Leading Article of Diet—Commercial Distribution Started in 1876 — This Year Has Been a Poor One For Canneries.

By W. D. BURDIS, Secretary British Columbia Salmon Canners' Association

FROM the earliest times in Canadian history, the oceans which bound Canada on the Eastern and Western sides, and the innumerable inland seas, lakes and rivers, all teeming with edible fish, provided a valuable staple food for the people, and ultimately developed into a great addition to Canada's foreign trade. It was not until after Confederation that British Columbia changed its status from a small British colony on the Pacific to that of a Province of the Dominion. By reason of its incomparable wealth in minerals, lumber, and fish, it now gives promise of becoming one of the most important parts in the commonwealth.

The Pacific Ocean and the large rivers along the 7,000 miles of coastline of this Province, were found to abound in fish of all kinds, of which the most noted was salmon of many varieties, bred in British Columbia rivers and matured in the Pacific, and which regularly returned in immense numbers after four years to the parent streams to spawn and die.

Commercial Distribution

The early settlers made salmon a leading article of diet, but it was not until 1876, that means were devised for commercial distribution beyond the limits where the fish could be transported in a fresh condition. Previous to that year, salmon had been canned in sealed tins on the Columbia River, with considerable success, and in 1876, three small plants were installed on the Fraser River, where every season millions of salmon ascended to spawn, and 9847 cases of the famous "Sockeye" salmon were packed and marketed. The fame of the product rapidly spread. On Puget Sound (where the fish pass on their way to the Fraser), canneries sprang up, as well as on the Fraser River, and salmon canning became an established business, with markets for the product all over the world.

Gradually salmon canneries were established at various points along the coast of British Columbia, and Alaska, and other grades of salmon were put up, but the name of "Fraser River Sockeye Salmon" kept up its reputation of being the choicest food of its kind, and demand was always in excess of the supply.

Beyond Economic Reason

On the American side, traps, seines of great length and depth, and gill nets, were permitted and operated far in excess of any economic quantity, and though earnest representations were made to the American authorities and operators on Puget Sound to regulate operations with some idea of conservation, little or no success was attained. For every sockeye captured in Canadian waters, two were taken on the Sound, though all the fish were bred on the Fraser River and were only transient visitors in American waters.

In spite of this over-fishing, the sockeye did not show much signs of depletion till during construction of the Canadian Northern Railway alongside the Fraser River. Then down the canyon, all the debris of rock excavated was allowed by the Government to be dumped in the Fraser River, filling up the backwashes, wherein the salmon could rest after negotiating the rapids, before proceeding further. In 1913 a huge rock slide occurred at Hell's Gate (the narrowest point in the Fraser Canyon) and many thousands of tons of rock fell in the river, just at the time when the salmon were migrating up the river to the spawning grounds, and millions of sockeyes died without issue.

Governments Became Alarmed

The Dominion and Provincial Governments were greatly alarmed and took measures to remove the obstructions at Hell's Gate and other points, but the irreparable damage was done.

How great was that damage will be shown by the figures following, in which three of the four big years in each cycle, are given, for comparison, viz. 1913, 1917, and 1921, respectively, the intervening years representing the smaller packs in each cycle which occurred in all former years since the industry commenced.

The packs of sockeyes, on Fraser River, were as follows—since

1913	684,496	Big year
1914	185,483	1st off year
1915	89,040	2nd off year
1916	27,394	3rd off year
1917	123,614	Big year
1918	16,849	1st off year
1919	29,628	2nd off year
1920	19,691	3rd off year
1921	35,900	Big year

It will be seen that there has been a steady depletion. Unless drastic measures are immediately adopted for conserving the comparatively small numbers of sockeyes coming to the Fraser, this species will be annihilated.

A treaty with the United States was negotiated after an International Committee of both countries had thoroughly investigated the situation, and suggested action desirable to be taken on the Fraser and Puget Sound to restore the supply. This treaty was approved by the Canadian Government, but defeated in the Senate of the United States—a fact greatly to be regretted.

An Off Year in Canneries

The State of Washington has appointed a Commission to administer the fisheries, but no action has yet been taken to save the unfortunate situation. This year, only 13 out of the 33 canneries on the Fraser River were operated. Other denominations are Red Spring, Pink Spring, White Spring, Cohoes, Pinks, and Chum salmon, all of which run

Canning the Product in the Factory

largely on the Pacific Coast and are extensively packed. During the late war, every effort was directed to putting up all the fish possible. When the war ceased the various Governments had large stocks of the cheaper grades of canned salmon on hand. The sudden marketing of these surplus stocks greatly disorganized the salmon market and placed the canners in a very difficult position.

The stocks they had on hand were unsaleable except at prices much below the cost of production, consequently they were adverse to packing more than they could avoid. However, the stocks are gradually being absorbed and matters will correct themselves in time.

Fish, during 1921, in every district in British Columbia, has been very scarce, as well as in Alaska. This scarcity is exercising the minds of all those financially interested as to the future. The industry in this Province is greatly hampered by continually changing regulations, ordained by the Department in Ottawa, which is under the control of the Minister of Marine and Fisheries. Strenuous, but ineffective efforts have been made to have the Fisheries placed under a separate and distinct administrator, with a Board in British Columbia composed of experienced and competent men, to deal with the fisheries on this Coast, and this desire is shared by the operators in every other section of the Dominion.

It is felt that the Fisheries of Canada are of sufficient magnitude and importance to warrant a Department devoted to its care and conservation, and that the permanent prosperity of the salmon fishing and canning industries depends upon the concession of these reasonable presentments.

Operations of Department of Public Works

The Construction Department for the Dominion—Covers Extensive Field — Some Sixteen Hundred Harbor Works — Fourteen Thousand Miles of Telegraph and Telephone Wires, etc., Come Under This Department's Control.

By J. B. HUNTER, Deputy Minister of Public Works

IT IS SELDOM realized the amount of work which is undertaken every year in Canada by the Department of Public Works. This department is really the construction department for the Dominion, and builds harbor works, such as piers, wharves, breakwaters and dry docks; public buildings such as post offices, customs houses, examining warehouses, drill halls, etc., government telegraph and telephone lines, and operates an extensive dredging plant for the improvement of harbors and rivers.

On the completion of wharves and breakwaters, these works are transferred for administration purposes to the Department of Marine and Fisheries and, in harbors of national importance, are in turn by that department placed under the jurisdiction of harbor commissions, where such exist. Ten years ago, the departmental expenditure on construction and maintenance was $11,807,000 and, as an indication of the increase in the construction of public works during the next few years, it may be mentioned that, in 1915, the expenditure increased to $29,283,000.

However, on account of the outbreak of the world war, it became necessary for the administration to adopt a policy of the strictest economy and to reduce the expenditure as nearly as possible to a maintenance basis, with the result that in the following years the outlay on Federal works under the charge of this department was reduced as follows:

In 1915, to	$19,539,000.00
In 1916, to	16,161,000.00
In 1917, to	14,055,000.00
In 1918, to	12,902,000.00

Within the past five years, the important works executed by the department have been the reconstruction of the Parliament buildings at Ottawa, the massive architectural dignity and beautiful interior finish of which will be a matter of pride to Canadians for all time; the construction and equipment of military hospitals for the treatment of returned soldiers, and the completion of works in the large and more important harbors on the Atlantic and Pacific coasts, and on the Great Lakes.

The works now under the control of the department comprise some 1,600 harbor works, 4 dry docks, 450 public buildings, and 14,000 miles of telegraph and telephone lines.

The maintenance of all these works in a serviceable condition has become a considerable undertaking, entailing a large expenditure, and, until there is an improvement in the present difficult financial situation, it is unlikely that canal and harbor development—other than the completion of such works as have already been commenced, will be undertaken. The new Welland Canal, when finished, will render necessary the improvement of the more important harbors on Lake Ontario and the development of a port of trans-shipment at its eastern end.

Larger schemes of development, such as the deepening of the Upper St. Lawrence, which has been, and still is, the subject of investigation and study by the International Joint Commission, will, in all probability, be forced to wait an increase in the resources of the country; and, until Canada's population grows to an extent that the trade and commerce of the country demand increased and improved transportation facilities by water, it should be the earnest endeavor of all Canadian producers to utilize the existing works and facilities to the maximum of their capacity.

Not more than one half of the population of Canada is living on the land. Cities and towns have grown faster than the rural communities.

Sorting and Grading Sardines

Development of Canadian Lumber Industry

Many Advances Have Been Made in Equipment—Process of Manufacturing Lumber Has Changed Considerably—Horizontal Resaw Now Used in Place of Circular Type

By G. B. VAN BLARICOM
Editor Canada Lumberman

IN THE Canadian lumber industry there have been many advances during past ten years in way of equipment, time and labor-saving processes, efficiency of operation, reduction of overhead expenses and facilities in handling, piling, shipping and distributing forest products. It is doubtful, though, if the number of sawmills in the Dominion is greater than in 1910; in fact, according to the returns received from the Federal Bureau of Statistics, there were nearly one hundred fewer plants in operation during the past year than there were in 1910-11.

Owing to the recession of timber supplies, the locations of plants are gradually being removed from the frontier of the provinces to the interior. This change of base is rendered necessary in order that driving conditions may be as short as possible and the industry carried on at close range to its raw materials. Many mills, which flourished a few years ago with a cutting capacity of from 100,000 to 200,000 feet a day, are now numbered among the institutions of the past. Such plants may be found at Deseronto, Waubaushene, Midland, Trenton and other towns in Eastern Canada. In many cases the limits have been exhausted and there are no further economically available sources of supply; then, too, the fire hazard in sawmills is something that has to be reckoned with, and during the past decade numerous large enterprises have been flame swept. These have been rebuilt in a number of instances but, in other cases where the supply of logs in sight extended only over a few years, arrangements have been made by the proprietors to have the timber cut up in some adjoining plant.

Thus, the pioneer, open door, speculative pursuit of lumbering is constantly changing and shifting operations. The very nature of the calling demands and challenges action and optimism. It requires men of faith, vision and courage to enter upon an industry which, according to the vast capital locked up, yields potentially smaller returns than numerous other undertakings of an industrial character. The amount of money invested in sawmills in Canada is, roughly speaking, $231,000,000, whereas a decade ago this sum stood at $146,000,000.

Wood Products Cut are Reduced

It is a rather strange fact, but nevertheless true, that in 120, according to a statistical survey of the lumber arena, there were less wood products cut in Canada than ten years ago. Last year, 1920—the returns for 1921, not being yet complete—the number of feet sawn was approximately four billion board measure, while in 1910 the quantity exceeded this by fully half a billion. There has also been a corresponding decrease in lath, but shingles have shown heavy increases principally in the West. Of course, the value of the products turned out has augmented considerably notwithstanding the annual diminishing cut. The uses for lumber are growing all the time in spite of views expressed to the contrary, and as the supply has become scarcer, naturally price levels have ascended.

Building operations, except those of an industrial character, were largely deferred during the war, and since the cessation of hostilities there has been a lively evidence of activity in the erection of homes, particularly in the bigger centres of poulation. The outlook is that the requisition for houses will continue unabated during the coming months.

There have been many changes in the process of manufacturing lumber, until to-day we have the latest expression of sawmill construction in the plant erected recently by Gillies Bros., Braeside, Ont. This mill is located in the Ottawa Valley and represents the most up-to-date erection in the lumber line in Canada. It is entirely fireproof, being built of brick, steel and concrete, while all the equipment is electrically driven. A new epoch is thus ushered in in sawmill construction. There are forty-eight motors, single and in groups, scattered throughout the various departments, ranging from 1 up to 150 h.p. The mill has a cutting capacity of 150,000 feet a day and in dimensions is 75 x 190 feet. It is the last word in enterprise, construction and appearance.

When Gillies Bros. were asked what their object was in investing such a huge outlay in a sawmill, they intimated that their limits would provide raw material for many years to come, that they were desirous of eliminating all danger from fire and turning out accurately-gauged and well-sawn lumber.

It may be of interest to the manufacturing world to note that by reason of this fireproof mill, the rate of insurance was reduced from $4.50 to 35c per $100., per annum.

Thus the era of advancement widens and, while time and labor-saving methods have possibly not been as pronounced in the sawmill line as in some others, yet there have been distinct changes from the old ramshackle, out-at-the-elbows mill structure with its snaky and wavy lumber to the great, modern electrically lighted plant with its huge output and up-to-date installations.

The process of manufacturing lumber has, certainly, made strides, and so has the art of the millwright, and, while it is not likely that many fireproof sawmills will be constructed, owing to the transitory character of the lumber industry in so far as the majority of sites is concerned, still there is about all progressive lumber plants to-day an air of neatness, attractiveness and productivity that is commendable. The yards are well laid out, the shipping facilities are splendidly arranged; all up-to-date structures are painted on the outside and whitewashed in the inside. Everything is provided in the way of sanitation, safety of operation, cheerfulness of surroundings and unity of effort. These outstanding facilities all make for economic operation, augmented capacity and decreased overhead.

The question naturally arising to one looking more at the mechanical end of the industry than, perhaps, to any other, is what constitutes efficiency in the sawmill? The three factors given by a leading manufacturer are—Plan your mill to save labor and eliminate waste; use the most effective and up-to-date equipment and give careful schooling and supervision to employees and operators of the machines.

In the last ten years there have been many changes, and one of the biggest has been the employment of the horizontal resaw instead of the circular resaw. The character of the mechanism has also had to be altered in a number of plants owing to the smaller run of logs. A decade ago 12-inch logs were common at the mill; to-day the general average is below this. The smaller log is due to closer cutting on the limits to eliminate dangers from fire and because of their proximity to the streams.

Evidences of Progress

The steam-feed system for the rapidly traveling carriages, the live rolls, transfers, chain conveyors, automatic trips, over-hung slash tables, automatic stamping hammers and other features mark the progress of the last few years, while in the yards heavy lifting has been practically eliminated. In several mills the lumber, as it is carried along in the sorting shed, has a runway considerably higher than where the sorters stand. This eliminates heavy work. The boards are placed in separate piles or bunches on turn-table lorries and hauled out to the yards by oil-burning locomotives. The lumber is then cranked off the roller-top lorries on to the piling frames, between lumber piles. The

average mill yard now contains many miles of standard gauge railway.

In the design or layout of many plants consideration has to be given to the character of the timber to be sawn, the use of by-products, etc. So far as efficiency is concerned, much depends on the layout of the mill, and the employment of modern machinery and placing it where it can be most conveniently and economically operated.

It was in 1890 that the first band sawmill in Canada was built by the Waterous Engine Works Co., of Brantford. This mill was especially designed for the eastern trade and went to the Gaspe Peninsula. In the course of the following three or four years the firm built several of these band mills, some of which were placed in Ontario plants. Most of them have disappeared but one is still doing duty in the Knechtel Furniture Company's factory at Hanover, Ont. It is understood that it is in good condition and performing as effectively as it did away back in 1892. This however, is reverting to a period anterior to the last decade.

Another feature in the improvements that have been made on sawmill resaws, is the spring cushion straining device, wherein a powerful compression spring is made use of with means provided for varying and indicating the strain to suit the different widths and gauge of saw blades.

Savings by Modern Equipment

Other alterations in connection with vertical sawmill resaws are in the shape of set works for positioning the feed rolls. Additional machinery of comparatively recent date constitutes not only vertical band resaws but twin and gang band resaws, which are said to have about twice the output of a single band resaw. Their use has naturally resulted in a saving of labor, increased the output and reduced the cost of production.

As already indicated, one of the outstanding features of the sawmill practice within late years has been the introduction of the horizontal band resaw, which many mill men believe has come to stay and will be used more extensively in future. One feature of this machine is its adaptability to all classes of work. The advantages of the resaw over the ordinary log carriage, when producing lumber from small logs, are that the feed is continuous in one direction so that there are no losses of time such as take place on the reverse run of a carriage; neither is there loss of power such as when a heavy carriage has to be reversed. The resaw operator does not have to possess the same skill as the head sawyer in the mill, and no dogging arrangement is required on a resaw since the slabs are handled face down, which automatically tends to the production of accurate lumber. Another argument in its favor is the thin saw kerf. As timber becomes more scarce, increasing attention is being given to the enormous waste that takes place in converting logs into lumber, and an important saving can be made by using equipment that will handle thin saws and thereby decrease the large loss that now goes into sawdust.

The fact that the use of the resaw and band saws, gang edgers, etc., has increased rapidly during recent years demonstrates that time and labor-saving methods are coming to the front, and one leading operator remarked recently that it would not surprise him to hear of a law being passed compelling lumbermen to use thin blades in the production of lumber, to conserve Canada's diminishing timber supply.

MARKETS SHOWSIGNS OF STRENGTHENING

Grocer and Primary Markets Reviewed—Tea Was First To Recover from Depression Period—Other Lines Are Improving

By J. L. WYCKOFF, Editor Canadian Grocer

DURING the past year, like other businesses, both retail and wholesale grocers have been passing through a depressed period and although at the beginning of the year stocks were fairly well reduced, heavy losses were sustained well into the middle of the year. At that period of the year, with perhaps the exception of sugar and farm produce, market conditions commenced to show signs of recovery. Prices too, owing to the liquidation of stocks, had reached bottom and in many instances to several points below replacement values. Up to this time merchants and wholesalers were buying in lots of only sufficient size to meet immediate requirements.

The first six months of the year fairly well cleaned up depressed stocks and with primary markets commencing to show signs of strengthening, the trade started to have a little more confidence and while the trade generally speaking continued to buy moderately, there appeared to be an improvement in the tone and on some lines such as canned vegetables, teas and jams, the movement was decidedly for the better.

Teas were one of the first commodities to recover. It will be remembered that the first of the year had a carryover of the largest stock of tea in the history of the business. Producers of teas at once started to curtail the production with the result that at the present time the production of teas is about 200,000,000 pounds short of a normal year. This curtailment has had the effect of steadily advancing prices and at the moment prices are some fifteen to twenty cents higher than at the beginning of the year. The markets continue in a strong position and there is every reason to believe that prices will go still higher as there appears to be a decided shortage on many grades.

Coffees, owing to distressed financial conditions in Brazil, were a little slower to recover but the last quarter of the year the markets have developed stronger tendencies with higher prices materializing which are likely to continue well into the new year or until the new crops are available.

Canners and packers of jams adopted a different principle this past year in that they only packed sufficient to fill orders that were previously booked. These future orders being very limited, packs were excedingly small as compared with previous seasons. This therefore resulted in a firm market for these lines and since the opening prices were named, many advances have been registered.

In flour and cereals, the markets held fairly steady to firm until the new crop was marketed and the market broke. Since then stronger tendencies have developed.

The feature of the sugar market has been the heavy carry-over of the last year's crop. The appointment of the Cuban Finance Committee to market the crop and their efforts to maintain a set price was a factor that drew outside sugars into the market at lower prices and resulted in Cuban sugars remaining unsold and created an unsettled condition. Prices for raws rapidly dropped and with the commencement of the making of the new crop Cuban sugar, the market had reached the lowest point since 1902. Canadian refined sugar although dropping to some extent, is still considered too high on a replacement basis and further reductions will no doubt be registered.

Everyone is fairly familiar with the drastic reductions taking place in farm products but these too, have recently taken an upward movement, the hog market especially strengthening very materially and from present indications is likely to hold which is also reflected in a steadier market for bacon. With these conditions existing and with spot stocks none too large the trade can naturally look upon the turn of the year with a greater degree of confidence.

A freak boiler explosion, of a most extraordinary character, recently took place in a plant at New Jersey, near Newark. The boiler, of stationary locomotive type, had long been out of service, and an inspector went into the fire box to look for defects. Soon he heard a fearful report. The furnace sheet had ripped open for a distance of about 36 inches directly through a weld which had been made in the sheet. It is thought that the sheet had been overheated in the welding process, had crystallized and consequently was under too great a shrinkage strain. It was found on examination that the defective part was practically free from scale. The accident shows up what dangerous stresses may result from improper heating in welding processes.

Iron and Steel Industry in Great Britain

In 1913 the Steel Business Was at Its Peak—1915 Saw Government Control—In 1918 the 1913 Production Figure Was Passed Easily—1920 Witnessed the Turning Point—Coal Strike in 1921 Caused Great Damage to Steel Industry

By D. ADAM, B.Sc., Assoc. I.M.M.
Assistant Editor The Engineering Review

BETWEEN 1911 and 1913 the iron and steel industry in Great Britain was on a rising curve of prosperity that reached its highest peak in 1913. In that year the output of pig iron was 10,260,000 tons and of steel, 7,664,000 tons, figures that had never previously been reached; while prices had not been so high since 1900 when the South African war influenced the market. Towards the end of 1913 there were indications that this high level could not be maintained. Germany, by means of subsidies, was making a strong bid for increased export trade and competition was growing keener. As an instance of the competition the British steel maker had to face may be mentioned that in 1913 the Rhenish-Westphalian Coal Syndicate granted a bonus of 1.50 marks per metric tin on fuel obtained from the syndicate to produce iron for export; the Pig-iron Syndicate granted an export bonus of 4.75 marks per metric ton on pig iron bought from the syndicate for the manufacture of goods subsequently exported, and the Steel Syndicate granted a similar bonus of 15 marks per ton. This subsidy policy in Germany raised her in 1913 to be the largest exporter of steel in the world with 5,664,000 tons. Great Britain followed close with 5,049,000 tons, though her total output was only about 57 per cent. of the German output,

Then in that memorable August of 1914 Germany decided that she could best further her ends by exporting her iron and steel in another form and the rivalry between Essen and Sheffield was translated to the field of battle. The politicians said "Business as usual" in the belief that some soothing words of reassurance were required to prevent panic. But already in 1915 it became painfully evident that something more than the usual would be required of the iron and steel industry if we were to withstand the torrent of steel that Germany was pouring on our trenches in France and Belgium. The Ministry of Munitions took control and the whole iron and steel industry of the country became more or less a Government department.

Output of Steel

The output of steel was increased from the 1913 figure of 7,664,000 tons to 9,540,000 tons in 1918 and estimates for 1919 had allowed for a further increase to 10,000,000 tons. Throughout the period of the war the prices of British iron ore, pig iron and steel were controlled. Shell steel was fixed in June 1915 at £15 per ton and early in 1916 commercial steel was given a fixed price which varied from £11-2s-6d per ton for joists to £12-10s for boiler plates plus a subsidy varying from 10s per ton in 1916 to 15s per ton in 1918. With the subsidies, therefore, the war price of commercial steel was nearly double the price ruling in the period 1911-13. The ratio of the war to the pre-war price must not, however, be taken as an accurate index of the difference in the cost of production, for during the war the government not only purchased the bulk of the steel output but, directly or indirectly, supplied the bulk of the raw material. In other words the government simply paid the steel makers a reasonable profit and took on itself the responsibility for any loss there might be between the raw ore and coal and the finished steel.

That there was a loss was evident when control ceased early in 1919 and prices were left to the free play of economic forces. Ship plates, for instance, which had been controlled at £11-10s per ton, rose immediately to £17-10s and nine months later in February 1920 were at £23-10s. The highest prices were reached about the middle of 1920 when steel was soaring to about £30 per ton under the influence of the post-Armistice boom. Then came the descent into the valley of trade depression in which we now are, with a fall in the price of steel to £25 per ton in January 1921 and to £10 per ton in December 1921. These figures cannot be accepted as a mathematically accurate index of the course of prices, since the pound sterling, in that period, was itself a variable quantity, but they serve to indicate approximately the "curve of prosperity" in the iron and steel industry since the termination of the war.

The year 1920, with a steel output of 9,000,000 tons, was the turning point. With the demand falling and a succession of labor disputes output and prices fell rapidly until, in consequence of the disastrous coal strike in the middle of 1921, the whole iron and steel industry closed down. Since the settlement of the strike a few blast furnaces have been re-started "to keep things going," but international exchange and the scanty home demand have, so far, proved an insuperable barrier to economic recovery and the British iron and steel industry is in the trough of a depression such as it has never before experienced. The output of steel for the first nine months in 1921 was only about half that of the equivalent period in 1920 and exports were lower in the same proportion.

Loss of Certain Markets

At the present time what is hitting the industry hardest is the loss of the European and Near East markets, through currency depreciation in these countries. British steel cannot compete in price with German or Belgian steel and only by the promise of early delivery have orders been secured. Nevertheless there is a vast latent market for steel in Europe which requires only some stability in international exchange to vitalize it and provide an outlet for British steel mills. This market, when awakened, should compensate for the loss of India, which now supplies nearly the whole of her own requirements and for those markets which have been captured in whole or in part by the United States.

It has been suggested that a closer commercial union between the overseas Dominions and Great Britain would make her economically independent of the continent but actually a large market for British goods in Europe is an essential preliminary to expansion of Imperial trade. About fifty per cent. of the iron ore used in Great Britain for steel manufacture is obtained from the continent, Spain being the chief supplier. If this could be obtained from Canada, either as ore or pig iron, a market would be developed that would allow of enormous expansion in the exploitation of Canadian mineral resources. It may be argued that Canada can make steel herself and, as occasion arises, supply Europe direct; but Great Britain's geographical position, the supremacy of London as a financial centre and, above all, the existence of steel making plants with a capacity of 9,000,000 tons a year make the proposition a sound one on strictly business lines, apart altogether from ties of kinship between the different parts of the Empire. The attempt has already been made to form a business partnership between steel makers in Great Britain and the coal and iron ore producers in Canada, but it was too premature for the reason that Europe is not yet in a condition to absorb the steel output that would result from the combination. A time more favorable to such co-operation will come. Though the British steel makers are more concerned just now with finding a market for their products than with finding the raw material to make them, it is not too soon to draw the plan of a campaign that will unite the two countries as closely as in those other days when steel of a high explosive kind was the chief demand of Europe.

Keeping Up With the Growth and Development

Many Heavy Passenger and Freight Locomotives Have Been Purchased During Last Five Years—Latest Type Develops Maximum Power With Marked Saving in Fuel.

THE CANADIAN Pacific Railway have maintained their motive power, rolling stock, and maintenance and repair equipment in keeping with the growth and development of locomotives and cars. This policy has involved continual improvement and betterment. The following paragraphs indicate to what extent this policy has been carried out during the past five years.

During the past five years the railway company have built and purchased a large number of heavy passenger and freight locomotives. These locomotives represent the latest development in the art, and are the finest type of motive power to be found upon the Continent. Both freight and passenger locomotives are the heaviest and most powerful in the Dominion. As an indication of the improvement and development in design it is of interest to note that these locomotives develop their maximum horsepower with a very marked saving in fuel.

In addition to the new and heavy power, the older locomotives have come in for their share of improvement, and many of them have been modernized, and their performance and fuel economy greatly improved by improvements in design. Some of these include re-designing valve motion to better distribute the steam to the cylinders, the application of brick arches in fire boxes to improve combustion, the application of superheaters to increase the volume of the steam, the application of automatic fire doors which prevent cold air from getting into the fire boxes and lowering the temperature of combustion, the application of power reverse gears which enables the engineman on switch engines or way freight engines to reverse the direction of movement easily, vastly improving the efficiency of the unit.

For a number of years all new locomotives have been equipped with vestibule cabs which completely enclose the engineer and fireman and protect them from the inclement and cold weather, and by making them very comfortable, enable them to do their work more efficiently. In addition quite a number of locomotives operating in bad water districts in the West have been equipped with tender tanks of very large capacity. These tanks hold 10,000 Imperial gallons, and enable locomotives to run past water stops where the water is not good, and where previously it was necessary to stop and take water. This results in decreased maintenance and better service, as bad water is a very large factor in boiler maintenance and operation.

Compound air compressors have been applied in large numbers to the locomotives, enabling air to be compressed and supplied for the air brakes and for air operated auxiliaries much more economically than with the simple type of compressor.

Freight Equipment

During the past five years, the railway company has built and purchased a large number of freight equipment cars. Of this number the greatest proportion are box cars of 60-ton capacity. These are very large and modern cars, being 42 ft. 1½ in. over buffers, having an inside clear length of 40 ft. 6 in., an inside clear height of 9 ft. and an inside clear width of 8 ft. 6 in. These are a single sheathed steel frame box car and represent the latest development in the art, being equipped with all steel ends and outside metal roofs. Where freight commodity is handled in bulk, and the distances are long, the large locomotive and large car are a very important factor in bringing down the cost of operation.

During this same period a large number of modern refrigerator cars were built. Other classes of car that have been built are steel ore cars, cabooses, flat cars, tank cars, coal cars and automobile cars, all of which were built in the company's own shop in Montreal. In addition quite a number of snow plows, flangers and ballast spreaders were constructed to replace older and less efficient equipment.

At the same time improvements have been made to existing equipment by adding steel ends, outside metal roofs, metal carlines, heavier couplers, improved door fastenings; all these improvements being of such a nature that they not only increase the life of the car, but keep it off of the repair track, thereby decreasing the cost of maintenance.

Passenger Equipment

During the past five years, a large number of steel passenger cars have been added to the equipment. These cars have steel frames and are finished on the outside in steel, but the interior is finished in wood, which adds to the general appearance and to the comfort, and which represents the latest development in the art of passenger car building. These are all exceptional cars and have been described at considerable length in the technical press. The passenger carrying cars have in them all facilities for the comfort of the passenger.

Improvements to passenger equipment during the same period have been considerable. A great many cars have been rebuilt and refinished in such a way as to add to their life, increase the comfort of the passenger and decrease the cost of maintenance. Many cars have had electric lights added to them, replacing the gas system. Screens have been placed in sleeping car windows, electric fans have been placed in dining and sleeping cars, smoking rooms have been remodeled, making them larger and adding to the facilities therein, improved ventilating systems have been applied, improved heating systems including a system whereby the passengers in sleeping cars can control the heat for each berth, rear end cars equipped with free cup vending machines, etc.

Shop Buildings

During the last five years the machine tool equipment has been added to, old machines being replaced with more modern machines enabling work to be turned out better and more cheaply. A number of shop buildings have been increased in size and equipment added to facilitate the handling of locomotives and cars, all of which results in economy. In addition, a great deal of attention has been given the reclamation of scrap material of all kinds. Bolts and nuts, lanterns, shovels and wheel barrows are reclaimed. Oil cans and various containers for liquid are manufactured from old paint cans. The addition of autogeneous welding equipment has facilitated the work of reclamation as well as repairs. Thin scrap metal plate is manufactured into washers and cotters. Scrap bar iron is straightened and rerolled into usable sizes. All scrap is sorted and that which can be repaired economically is reclaimed and used again, greatly decreasing the cost of maintenance.

FLYING IN A FOG

The maintenance of a continuous service by aircraft depends upon several factors, one of the most important being the ability to fly during foggy weather. Direction-finding by means of wireless telegraphy has been of great assistance in this direction, but a much more elaborate and promising aid has been recently devised by a British engineer. The apparatus consists of an upper row of lamps controlled by a gyroscope, and by an air speed indicator, the pilot is given all the information he needs to fix his position during fog. Point-to-point flying can therefore be undertaken with the certainty of reaching the desired destination. The speed of the machine through the air, the rate at which it is turning, the direction of sideslip, and the movement required to keep the correct course, are all recorded. Experiments with this apparatus have been going on for over 18 months and manufacturers are said to recommend its use with confidence.

Many Important Factors Must be Considered

To Get Credit the Manufacturer Must Convince Banker That He Knows His Business—Can Buy His Raw Materials Wisely—And That His Labor and Production Costs Are Reasonable

By J. W. TYSON, Editor Financial Post

SINCE THE days of Shylock—if not before—bankers have been unpopular. This is not hard to understand. Every person is inclined to rate his credit higher than may appeal to a disinterested party and particularly to a person asked to advance money on it. And then if the banker in exercising his judgment makes a loan which cannot be repaid when due the borrower feels that, like Antonio, he is the victim of spite. As a matter of fact, it must be plain that banks and bankers do not want "revenge" on their customers. Shylock was a poor banker—he was not even in the meat business. What any competent bank desires is to get back the bank's funds in accordance with the terms of the loan, together with a fair rate of interest. To renew loans means frozen credits and that is a reflection of business stagnation. To enforce the letter of the bond means to take over the business involved and that is the last thing that the bank or the banker wants to do. Banks deal in credit. They want to merchandise all the credit they can because the turnover means profit as in other lines of business. The more successful the merchant or the manufacturer the better they are pleased. To force the customer into liquidation usually means that the bank has to go into the retail business or the manufacturing business until assets can be realized on—and that is about the last thing they want to do.

When, therefore, it is stated that the banks have curtailed their current commercial loans during the year by about $160,000,000 there is a general impression in business circles that this is the explanation of the depression which has been experienced. As a matter of fact this reduction of about 12 per cent. —and it has been greater than indicated in the case of manufacturing and trade because of the increased demands of agriculture—is the effect of the readjustment, and not the cause of it.

The dominating factors in business are physical rather than financial. For a time war credits resulted in world-wide inflation through the high prices which necessity involved. Then came the realization that the nations must set their houses in order. Instead of huge government consumption at high prices it became necessary to find normal markets. For a time war funds in the hands of individuals and demobilization expenditures by governments maintained public buying but this finally subsided. War-burdened European nations were not in a position to buy our agricultural products at war prices. Prices slumped. Our farmers found their profits shrinking to the disappearing point. We are now experiencing the process of getting prices for manufactured products down to a basis where normal consumption can again be encouraged. Until that time depression in industry seems bound to continue. The weather conditions in Western Canada during the harvest season served to aggravate the situation in a market to which the manufacturer looks to provide the difference between minimum and maximum production. At the same time markets for manufactured products are largely closed because of the return of Europe to industrial activities and the lowering of manufacturing costs with the necessity of finding markets for the products of factories which were so long engaged in making munitions.

Thus we have at present a situation in which the popular idea that industrial depression is caused by the attitude of the banks is far from the real explanation. Quite true, the banks could lend more money on commercial credits at the present time. But could they lend it profitably? Careful students of the situation opine in the negative. In order to get credit a manufacturer must not only be able to convince the banker that he knows his business, but that he has bought his raw materials on a sound basis, that his labor and other production costs are reasonable and that he can find a market for his products on terms to show a satisfactory margin of profit. If the manufacturer can do those things he should not have any great difficulty to get a line of credit. To give credit on any other basis is not good for either the borrower or the bank.

Adjustment of Physical Factors

It is then an adjustment of the physical factors that is desirable. If raw materials can be brought down to a sound market basis and labor transportation and other costs adjusted so that goods can be produced at costs which will encourage normal consumption by farmers and others who are experiencing curtailed buying power, then there should be no reason why the bankers should hold tightly to the purse strings. But until such adjustments are made the attitude of the banks will no doubt reflect the industrial outlook and if in addition there is some tendency to take a conservative view of the unsettled outlook it is hardly a matter for surprise when recent experiences are considered.

The matter of bank interest rates on loans is another point on which there is at times considerable dissatisfaction on the part of manufacturers and other borrowers. This dissatisfaction naturally develops during a period, such as that recently experienced, when capital becomes more plentiful and quotations on money rates in New York, London and other financial centres show lower levels. Little is heard, however, it might be pointed ont, about the advances which take place at other times and which, like the declines, are not reflected in the rates which are charged by the Canadian banks.

Recently a rate of 5½ per cent. has been quoted in New York. A comparison with Canadian rates is not fair from many points of view. In the first place the 5½ per cent. rate quoted is one that is not generally applicable. On the other hand the general custom in the United States in regard to such loans is radically different from that in Canada and results in a net rate that is considerably higher than the nominal one quoted, around 5½ per cent. A short time ago when a customer of a Canadian bank applied for a loan in New York from a Canadian bank, he was informed that the bank was not accustomed to loaning to its Canadian customers there to any extent, feeling that it should use any cash available there for strictly call loans, which could be turned into cash on a few hours' notice. This course they would not like to take with a Canadian customer and in order to preserve their policy of keeping their funds in New York in a liquid state they advised him to apply to United States banks. He did so and found that while he was allowed a loan he could withdraw, as a matter of fact, only 80 per cent. of it. Twenty per cent. he was compelled to leave with the bank as a form of cash balance, or "free money," on which he would receive no interest. Apart from that, interest of 5½ per cent. was being charged him on the full amount, so as a matter of fact he was paying over 6½ per cent. for the money he was using.

The Canadian practice is entirely different. As a general rule the loan for commercial purposes is honored to the extent of 100 per cent. of the credit provided by the bank so that if the rate is 6 per cent., which is the prevailing one, the borrower pays only 6 per cent. instead of paying also for a balance which he is not allowed to use.

But altogether apart from present conditions which in themselves are not unfavorable to the Canadian borrower, there remains the fact that during the past few years, not only during the war but afterwards, interest rates rose sharply in New York, while the Canadian banks continued to lend money and to extend credit for exactly the same rate as prevailed many years ago. The rate of 6 per cent. remained practically

(Continued on page 168)

Believe Spring Will See an Improvement

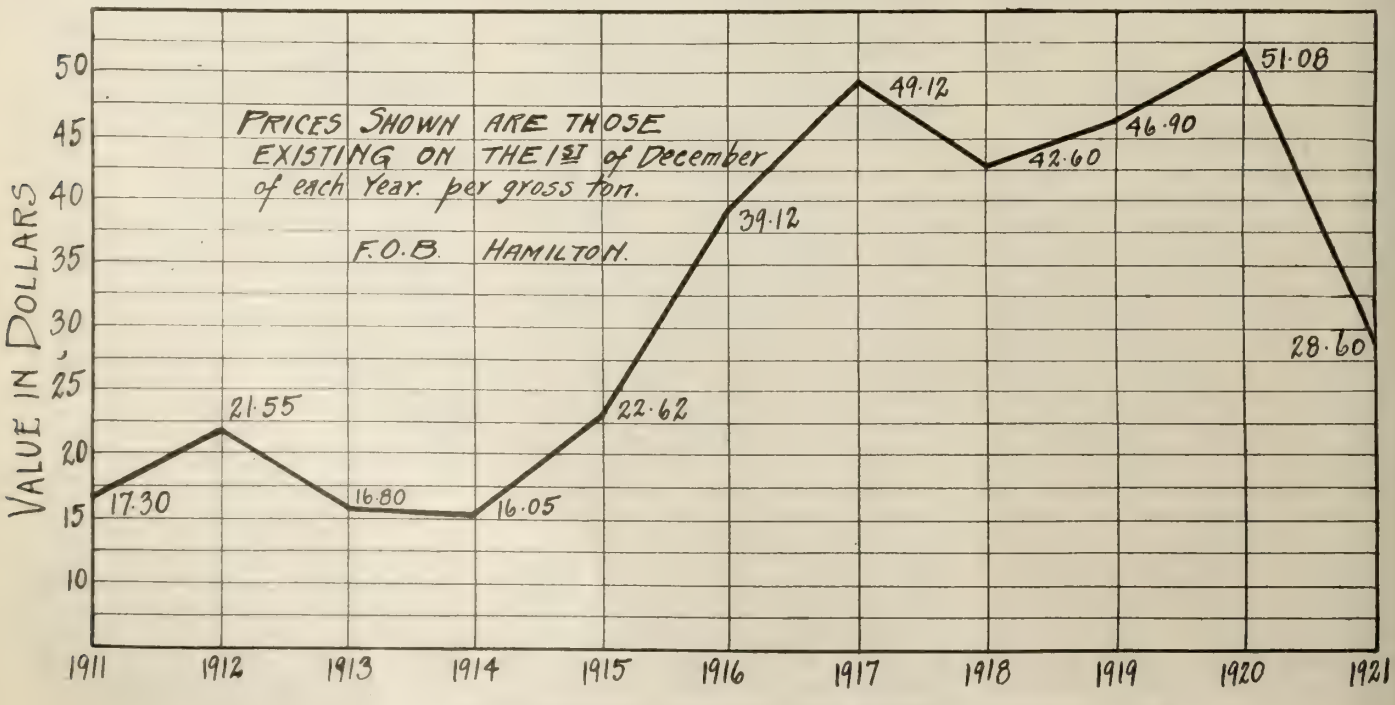
Although Production of Steel Has Dropped Rapidly During 1921 The Present Decline Will Not be of Long Duration—Things Must Be Brought to Economic Level Before Upward Tendency Begins

By J. M. ELSON

FROM BELCHING smoke-stacks blazing furnaces and the noise of almost ceaseless activity, reaching a hundred per cent. production in 1920 down to comparative quiet and from only 50 to 65 per cent. production in 1921, is the story of rapid decline within twelve months of the steel industry in Canada and the United States. As for 1922 the outlook, just now, does not appear any too bright though there are reasons for the belief that the spring of next year will bring an improvement.

As steel and iron enter so largely into numerous lines of business the steel market has long been taken as a sort of barometer for financial, commercial and economic conditions so that the public mind has acquired the habit of looking to this industry as a man looks at the sky to see what the weather is likely to be. When the furnaces of these plants are going full blast it is a pretty good criterion of the health of trade generally. When they are allowed to cool off and there is a small list on the pay roll it can be assumed that there is more than one cloud in the industrial sky.

It will be recalled by those who observe these matters that last year was one of the most prosperous that the steel plants of Canada have known. They were kept going, often to capacity, to fill the orders that came to them. The industry, like several others, reached its peak. But just as the commercial tide flowed, so it ebbed and all this year it has been running out, leaving on the shore mills of vast proportion and very large capital investment with a greatly reduced volume of business to do. The suddenness of the downward tendency in prices for their products has been as sharp as that experienced in any department. The figures quoted above showing a falling off of fifty per cent. in some plants is an index as to what has occurred in associated branches of business. Until there is an improvement in building, in railway purchases, in automobile manufacture, harvest machinery requirements and other allied industries where these heavy metals are constituents, leading men in the steel world cannot feel very sanguine over their own prospects.



By men in positions of high responsibility it is stated that the potentialities for a revival and for a gratifying increase in the steel business are existent in Canada, but fundamental principles have to be recognized and applied before the doors of purchasing agents are open for large orders. High freight rates have imposed a burden which tends to restrict the market. Labor costs and the availability of money must also get more to normal. As long as too many weights are loaded onto one side of the scale the other side cannot come up.

For many months now people have been buying in small quantities and from month to month. Firms today order thirty and forty tons of material from the steel mills where before they ordered three or four hundred tons. The same ratio of purchase is said to prevail in nearly all departments of trade. The obvious consequence is dullness in the manufacturing end as well as in the wholesale and retail departments of business life.

A fairly intimate view of the steel situation was secured by Canadian Machinery through the courtesy of Mr. Robert Hobson, President of the Steel Company of Canada, whose principal plant extends itself over a wide area of Hamilton, Ont. Mr. Hobson was recently in New York, meeting executives of the steel industry in the United States. The consensus of opinion there expressed, he observed, was that little improvement in the trade is expected till about March next. Some views were given, in fact, that business could scarcely be expected to return to anything like normalcy till new crops were grown.

Answering the questions about his own company, Mr. Hobson said they had been able to keep up around a 65 per cent. production because they turned out steel in finished products such as screws, wires, nails, wrought pipe, forgings, angle bars, spikes, etc. In this way a more diversified and constant market could be served than was available for mills whose product was principally in rails and other heavy forms. nevertheless the decline experienced in business this year had been very sharp and serious.

"High freight rates and generally

Graph showing how prices have been for 1921.

stiff costs for labor and for the raw materials used in making pig iron all tend to keep up prices in metal products," commented Mr. Hobson. "It costs as much for freight to make a ton of pig iron as we were formerly able to sell a ton of pig iron for. Until these heavy charges come down it is apparent the price of pig iron will be up. To be more specific, pig iron sold for $14.50 per ton before the war. Now our freight on the raw materials going into a ton is $14.50 alone. In fact very few firms can sell pig iron today at from $19.50 to $21.00 per ton without sustaining a loss. Some of the plants in the United States are able to sell at these figures but they own their mines and some of them own their water-borne freight carriers."

Remarking on production costs in industries generally, Mr. Hobson said that they will be kept up to an unsound level as long as workmen are indifferent to the meaning of efficiency. "Until men give one hundred per cent. of labor," he said, "for one hundred per cent. of pay it is impossible to get things down to a proper economic level. In this connection, however, I want to say frankly that the workmen in the employ of our company should be given credit for their business sense and fairness. They have faced facts in a reasonable, tolerant mood. They have taken necessary reductions in wages with a sane spirit. As a result the maximum of employment can be given in dull times. They have put more efficiency, too, into their work. I am glad to say this for them, but I regret it cannot be said of all workmen in Canada and the United States."

Touching upon trades in which steel is largely used, Mr. Hobson remarked upon the fact that shortage of money in the country had lessened the production and sale of automobiles and had restricted building operations. Poor crops in the west and low prices for farm produce had placed the farmer in a position where he could not buy implements as he did a year or so back. All of these circumstances had helped to cripple steel, but like other business men he held that the potentialities of Canada were great and perhaps a good crop in 1922 would go a long way toward restoring the monetary and trade strength.

BUSINESS CONDITIONS IN FARM MACHINERY INDUSTRY

By A. M. ALLAN, Editor Canadian Motor Tractor And Implement Journal

THE farm machinery industry just now is passing through one of the most trying periods in its history. The year just gone will long be remembered. It saw varied and dramatic changes, from highest peak of optimism during the first three months, to an almost unprecedented gloom about the beginning of the last quarter. Mid-summer saw most of the farm implement factories either shut down or working on a curtailed basis. Since that time there has been no considerable improvement. There has been a slight activity by certain manufacturers, but those who are operating are producing mostly for export markets and for stock rather than for actual orders.

At the beginning of the year prospects for business were good and business actually done during the first three months compared favorably with that of the corresponding period of the previous year. It was noticeable though that sales were harder to make. Those dealers who were content to carry on with the order taking methods of 1920 did not meet with much success. But on the other hand dealers who got down to intensive selling were able to show an increase. This inactivity on the one hand and activity on the other struck a balance compared with that of 1920.

Manufacturers and dealers all spoke of a resistance to sales. This resistance became stronger as the year advanced until by spring and early summer it became well nigh unbreakable in some districts.

The cause of this resistance in the main was the drop in the prices of farm products. During 1920 the farmer farmed the most expensive crop ever produced. His labor costs were tremendous, but as he had been getting $2.50 a bushed for wheat and was looking for $3 wheat he was not worried much, figuring that with a bumper crop ready to harvest at high prices he was due to make large profits. Then the crash came. Wheat suddenly took a tumble. In the course of a few weeks it was down to $2 a bushel and by the turn of the year it reached as low as $1.87. The farmers' refusal to buy was not so much on account of his unwillingness but because of economy in order to liquidate his obligations, and the necessity of growing the new crops at a cost within the current market values.

The western farm machinery dealers have had a harder row to hoe than their brothers in eastern Canada. The fall in prices affected the west to a greater extent owing to the fact that wheat is the principal product of the western farm. The farmers in old Ontario and Quebec operate largely mixed farms giving them a bigger margin of security.

The farm machinery sales for 1921 in Ontario will be perhaps about 65 per cent of 1920. The west won't show more than about 35 or 40 per cent. In Quebec and the Maritime provinces sales have been poor.

During October, November and December, there has been some activity in engine and cutting box sales owing to the abnormally large corn crops. This only applies to Ontario, Quebec and the Maritimes.

There has been little implement or tractor production during the last year. Dealers have had difficulty in selling tractors and the numbers sold were few

New prices have recently been announced for 1922. With the lower prices manufacturers and dealers are hopeful that the new levels will induce the farmer to buy. The farmer is beginning to realize that other commodities are gradually coming to a price level more nearly approximating that of his own products, the psychological effect of which may tend to bring him again into the market as a buyer.

The outlook for 1922 is for a volume in dollars and cents about equal to the volume of 1921, which in view of price reductions would mean an increase of 25 to 30 per cent. in tonnage. If this is accomplished the industry as a whole can pat itself on the back.

We believe the worst has been passed but there will not be any considerable improvement until another crop is harvested.

A Typical Farm Scene in Canada.

How Can Canadian Factories Economize

Some Important Questions Ably Answered—Manufacturers Are On Their Toes and Keenly Realize the Present Situation—Methods of Reducing Manufacturing Costs

HOW can Canadian factories economize, so that production costs can be reduced?

"Have you had any difficulty during the past year securing raw material? Has labour been difficult to handle? Have you had success with some profit sharing or bonus plan? How does the efficiency of labour compare with that of 1914?

"Taking into consideration the fact that what Canada needs is population to develop her resources, should there, in your opinion, be any arbitrary restrictions placed on immigration?

"Do you believe that truck haulage for short distance shipments is better than railroads?

"When, in your opinion, will buying reach normal? When that time comes do you imagine that the existing conditions of machine tool equipment in factories throughout this country will necessitate to any large extent the purchasing of new and more modern equipment?

"What relation do you think wages should bear to production costs?

"Do you believe the present home markets are sufficient to keep Canadian factories busy, or do you think Canada should go after export trade? If you feel that securing export trade is of sufficient importance, what lines do you believe should be extended?

"What do you think of the railroad situation in relation to trade? Would lower freight rates help the business situation?

"In your opinion what are the best lines for Canada to develop in the near future?"

Believing that readers would be interested in hearing opinions on the above questions, we have secured from various manufacturers some interesting viewpoints. Here is what they say:—

BELIEVES IN PRINTED RECORDS

By F. E. MUTTON, General Manager International Business Machines Co.

ANSWERING your various questions in order I would first of all emphasize the fact that Canadian factories can economize and reduce production costs by having printed record of time spent on each operation by each employee. Further, costs can be reduced by eliminating in a great many cases at least 10 per cent. of the present staff. The other 90 per cent. will work harder and work faster. This applies to the entire staff of any organization aside from the sales force. Costs can again be reduced by having a proper time system, control of office staffs, and bringing about punctuality. This in many cases is a great loss which naturally adds to costs.

We have no difficulty in securing raw material or labor, and I do not consider that arbitrary restrictions are necessary as related to immigration, but I do believe there should be restrictions which will have such a tremendous bearing on the future population of Canada.

Truck haulage for short distances is, to my mind, better than railroads.

I feel that buying may reach normal conditions by the summer of 1922, though with ourselves for most of our product, buying has been normal the last three or four months. In one of our divisions, buying this year has been considerably above normal. We have no apprentice system.

I do not consider that home buying alone will keep Canadian factories sufficiently busy. Canada should certainly go after export trade. Lower freight would certainly help business, but I am not in favor of government control of railroads.

The amount of wealth which annually vanishes in smoke is amazing. Every year there are upwards of 33,000 forest fires, involving some 12,500,000 acres of timberland and costing in loss about $20,000,000, occurring in the United States.

CANADIAN FACTORIES ARE UP-TO-DATE

By P. FORD-SMITH, Manager of Ford-Smith Machine Co.

IN ANSWERING your questions let me say first of all that I believe Canadian factories are run economically at present. Those that are not are either out of business or are on their way. What we need here is the quantity of goods so that we can get better production methods. This means the growth of the country with its proportional demand. In this connection, I might say, as having had experience both in United States and Great Britain, that few people realize the difficulties of trying to run a business, at least in the machinery line, on the small quantities of any item which the Canadian trade requires.

We have had no difficulties with material or labor. The efficiency of labor is improving all the time. To my mind we can do with all kinds of immigration, but it should be closely supervised.

It is pretty difficult to say when buying will reach normal. I do not think that there will be extensive buying of new machine tool equipment for a very considerable time, maybe two or three years.

To my mind Canada certainly needs export trade along certain lines. Lower freights, like any other lower charges will certainly help business.

SHOULD TURN OUT WORK PROMPTLY

Personnel of Every Factory Should Permit Quick Turnover of Orders—Canada Requires Increased Population

By W. G. HARRIS, President Canada Metal Co.

IN MY OPINION, the personnel of every factory should be kept at a point that will permit orders to be turned out promptly, keeping only men who will give a fair day's work.

Our raw material has been abundant, and at lower prices. Labor gives no trouble, for with many to choose from, those we employ appreciate the steady employment we give. We have no profit-sharing schemes, and do not find it necessary, paying as we do, the best wages obtainable.

Canada requires increased population. In Great Britain today, many thousands are ready to come to this country, with a government system that will place men on the land, and keep them there.

Truck haulage or radial railway, we find very convenient and quick, in that goods shipped can not only, in many cases, be received in the cities and towns, but delivered at the customer's store, without delay, at no more than rail cost.

In the building of homes, it would not take much to make a very great rush in building, owing to the very high prices being paid for houses built some years ago. If money, cement, brick, labor and enamelware, were at a more reasonable price, there would be a boom that would carry prosperity to many other lines of trade.

The present home market would not build up in Canada, sufficient business to keep Canadian factories going, for while at present the countries that I visited in the past three months, such as Belgium, Holland, Germany, Switzerland, Italy and France, are striving to their utmost to keep all trade within their own borders, there is no doubt, if a within the empire policy was inaugurated, an export trade could be developed, and it is vital to big business, that it is developed.

The high cost of railroad freight and fares is a detriment to business, especially freight from the heart of Canada, to the

East and West, it being almost prohibitive. Lower freight rates would start things.

In reference to the best lines for Canada to develop her wheat, mines, clays, coal, asbestos and basic industries should be pushed. There is not a doubt that to-day, even with the handicaps that we have, that Canada under the British flag is the finest country in the world to live in, for in travelling the old lands, I found no better dressed, better fed, more law abiding or prosperous people than those in Canada, and I came home realizing more than ever, the great inheritance Canadians have.

MORE EFFICIENT MACHINERY NEEDED

By GEO. A. TRUE, President Northern Crane Works

TO MY mind the economies in Canada can be effected by using more efficient machinery, and by introducing labor handling machinery, such as cranes, hoists, etc. Aside from that, labor rates and overheads must be reduced.

We have had no difficulty in getting material; no difficulty in getting labor or handling it; no chance to try bonus plan effectively owing to too small volume, and labor is more efficient as compared with 1914, although this may be due to better equipment.

I would say "Yes" to question No. 3, and "No" to No. 4, while I do not care to make any predictions regarding your query No. 5.

Answering No. 6, I would say "Yes" in a limited form. It is of benefit, or we wouldn't use it. I doubt if present home markets are sufficient. There is difficulty in developing the export trade, for Canada must get her material prices down on a basis with United States prices in order to be effective in the export game. In conclusion I certainly believe that lower freight rates would help business.

PRODUCTION COSTS HAVE BEEN REDUCED

Many Economies Can Be Effected by Careful Analysis of Cost Statements—Improved Supervision of Workmen and Greater Attention to Quality of Raw Materials

By W. C. FRANZ, President Algoma Steel Corporation

TO YOUR question No. 1, I would reply that our experience has been that production costs have been reduced in a great many of the industries during the past year, and the principal items affecting this reduction are lower rates of wages and increased efficiency of the workmen. Many economies can be effected by careful analysis of cost statements, improved supervision of workmen, and greater attention to the quality of raw materials. Modern methods of handling material show reduction in expenses, but in most cases very careful study should be given to any new and improved equipment.

We have experienced no difficulty in the past year in securing sufficient stocks of raw materials. Labor has been very reasonable, and we have had no difficulties with our workmen. A large number of our employes receive bonuses on basis of tonnage produced. Labor efficiency, while not yet at pre-war standard, has made great progress during the past year.

My opinion in respect to arbitrary restrictions on immigration is that some limit should be placed on immigration from foreign countries, and especially former enemy countries, and on the other hand, special attention given to the promotion of immigration from the British Isles and the United States, in order that the task of making good Canadian citizens should not become heavier than we can handle.

We have had no experience with truck haulage as compared with railroad transportation, so cannot venture an opinion.

It is most difficult to say when buying will reach a normal basis, but it will not be until six months to a year after the general public is convinced that liquidation of prices is fully accomplished. At present all factories are buying supplies on a hand-to-mouth basis and practically no new equipment except for replacement.

We have a system of apprenticeship in our shops, which is giving very satisfactory results.

I believe the present home markets are sufficient to keep Canadian iron and steel manufacturers busy. We are not interested in export business on account of our location.

I think the railway situation has a very important effect on trade in general, and believe a reasonable decrease in freight rates would stimulate business quicker than any other one thing.

Canadian manufacturers should, in my opinion, first give attention to the domestic market in the development of industrial undertakings. The large volume of imports, especially from the United States, shows the extent of possible business to be done. Considerable progress has already been made in the production within Canada of finished products from the raw materials from our mines, forests and farms, and speaking as a steel producer, we would like to see all classes of finished steel produced in Canada so as to take care of home markets and cut down the imports, and we are very much interested in the production of finished steel products from iron ores mined in Canada. Every assistance should be given the prospector and mining company in their efforts to locate and render merchantable our own ores.

EACH INDIVIDUAL FACTORY IS A PROBLEM BY ITSELF

Canadian Factories Compare Favorably in Economical Administration and Production with Factories in Other Countries

By T. R. DEACON, President of Manitoba Bridge and Iron Works

YOU HAVE compiled a list of questions, which to answer the same in detail is rather a tall order. However, here is my opinion on the various subjects:

In replying to question No. 1, I would say that this would depend entirely on each individual factory. As a general rule I think that Canadian factories will compare favorably in economical administration, and production with factories in other countries. Each individual factory is a problem by itself

We have had little difficulty in getting material this year. We have had no trouble with labor. Since a few months after the big strike in 1919 we have had a plant council in operation in our plant, with very satisfactory results. It has increased the efficiency of the shops very materially, and has practically eliminated all friction as the men's representatives are taken into confidence in discussing policies of the company, and the results have been entirely beneficial.

I have grave doubts as to whether any benefits would accrue in Canada from allowing immigrants to arrive in the country during the winter months, or say prior to the first day of April, unless they have ample means to take care of themselves. Immigrants arriving during the winter months without funds and without experience are bound to become a burden on the country.

I do believe that for fairly heavy loads, say 2½ to 5 tons, and with good roads, where the stuff can be loaded at the shops or warehouse and be delivered at the other end exactly where it is wanted, that truck haulage is a considerable advantage over railroads in that it obviates two handlings of the material, once off the trucks on to the railroad, and again off the railroad to point of consumption, besides ensuring prompt delivery.

I have no idea when buying will reach normal. I think that the solution of this problem lies with the policy of the United States. They stayed out of the war for three years until they accumulated a large part of the gold reserve of the world. As soon as the war was over and they had all their customers' gold they shoved up their tariff walls, refused to sell goods except for gold, and would not allow their customers to ship

in goods in exchange. As their customers had no more gold they could not purchase their goods, resulting in closing most of the factories in the United States, and they are now in the position of King Midas with the golden touch. Until they are willing to make some arrangements with the other nations to let this gold go back into the use of the world, conditions, in my opinion, will mend but slowly, and if by any means we had a government in Canada who attempted to make an experiment with Free Trade, the result in my judgment would be disastrous. A general collapse of industry from one end of Canada to the other would result which would react over other lines.

In mentioning the relation of wages to production, I think this depends entirely on the class of goods produced, and no general rule can be laid down.

All factories in Canada that are situated within reach of tide water and in a position to export, should go after export business. This includes every line that can be sold at a profit abroad.

I am probably the only man in Canada who does not know how to solve the railroad proposition. To me it appears under present conditions insoluble. If it were not for the fact that any government has to depend on votes, I have no doubt enormous savings could be made in the operation of Canadian Railways, when lower freights could be had, and there is no question that this would help business. The transportation charges on long distance haulage now is a crushing burden. The conditions under which the railroads are practically compelled to operate do not allow them very great latitude in the reduction of freights.

Primarily Canada should develop her agricultural resources; secondly her forest resources; thirdly her mining, and fourthly her maritime resources, fishing and transportation.

LABOR HAS BEEN EASY TO HANDLE

Believes in Piecework Provided Rates Are Sufficient to Give Good Wage—Normal Buying in About Another Year—Apprenticeship System Pays

By JOHN S. LEITCH, Managing Director Collingwood Shipbuilding Co.

I WILL reply to your questions in order: First, I believe that the best way to reduce costs in factories where numerous duplicate articles are produced is piecework. Paying for results provided the rates are sufficient to give a good wage to the workman or workwoman is an incentive to greater production.

We have had no difficulty in securing raw materials. Labor has been easy to handle. We have no profit-sharing system. We are very dull at the present moment but I imagine the efficiency of the labor would compare with 1914.

I believe, while Canada is very sparsely populated, only slightly over two people per sq. mile, I understand, yet I think it is wiser to wait and populate with a good clean class of people rather than bring in a lot of undesirables in a hurry. If we want a clean class of citizens the only way is to select them carefully.

I think for short distances, truck haulage is better than railroad. The goods would have to be loaded on a truck in any case, taken to the railroad station, there taken off the truck and put on board the car. At their destination, a short distance away, a similar operation would have to be undertaken, while with an all truck haulage there would be only one loading and one unloading. I should imagine that the truck haulage would also be much quicker as it is quite possible that the railroad company might want to wait until they had a complete carload before shipping, consequently an unnecessary delay. We have no truck business here so that my opinion is not based on actual experience.

I believe it will probably take another year before buying becomes normal. In the case of shipbuilding, ship owners who require vessels have been holding off and are still doing so waiting for labor and materials to cheapen. Steel is not likely to go much lower for some considerable time to come and labor is still a great deal higher than it was in 1914. I do not think any drastic changes would have to be made in the conditions of machine tool equipment in the average factory.

We have an apprenticeship system and believe this is the proper way to train mechanics of all kinds. When a boy knows that he is engaged to learn a particular trade I think it steadies him down, as ordinarily I found here that they wanted to change from job to job as the spirit moved them.

It is difficult to answer your question regarding the relation that wages should bear to production costs as no doubt every industry will be somewhat different.

I think Canadian factories should develop export trade wherever possible as it brings fresh money into the country.

Lower freight rates would certainly help business considerably. It is difficult for some industries to live in Canada without protection. Ships, for instance, can be imported free of duty. The newspapers recently stated that nine French ships had been bought by a Canadian owner. These vessels were built by the United States, sold to France, registered in Great Britain and can now be brought into Canada free of all duty. Old ships are continually being brought on the American side of the Great Lakes and the register changed to Canada. Canadian shipyards, therefore, instead of building these vessels for Canadian trade, can only look forward to carrying out any repairs which may be necessary from time to time. The Government has been asked for help from time to time but nothing has ever come of it.

MANUFACTURING COSTS CAN BE REDUCED IN TWO WAYS

Increase Output and Cut Down Expenses — Raw Materials Have Been Plentiful—Only Best Class of Immigrant Should Be Sought

By W. H. CRABTREE, Howard Smith Paper Mills

I HAVE given some consideration, and in replying I have been of course, influenced by the conditions obtaining in our own industry, but doubtless they are, to a certain extent, common to all industry. Answering your questions in order here are my views:-

1.—Manufacturing costs can be reduced in two ways:—a.—Indirectly, by increasing the output; b.—Directly, by cutting down expenses.

Let me first deal with:—(a) I quite appreciate there must be a possibility of doing this, in so far as the plant is concerned, and a market provided for the increased product which it would turn out. But if the product be a standard staple one, the export fields should be exploited, even if it is necessary to sell at mill or factory cost on that portion of the output which it is found necessary to export. This increase of production will result in the plant specializing on grades or lines which it finds itself peculiarly adapted to make, and this will result in a lowering of the expense cost on its entire output.

(b). In considering the direct way of reducing expenses. Apart from putting each plant on as efficient a basis as seems possible, from a knowledge of conditions obtaining in our own industry, I am convinced that very material savings could be affected in Canadian factories by a free exchange "between kindred industries" of departmental costs, of information respecting working conditions, classes of materials used, etc. Some factories may be much more efficient in certain ways than others, but may show much greater costs in other departments. Leaving out the question of policy, if the plants could adopt the way of the most efficient in the respective departments, great economies would result.

My answer to question No. 2 is that raw materials have been plentiful. Labor has on the whole adopted a very reasonable attitude, and has taken the reductions which it has been found necessary to make, in the right spirit. We have had success with our employes on a basis of piece work, but this seems to be the only way that works out satisfactorily, aside from a per hour rate. The efficiency compares very favorably with 1914.

Regarding your question No. 3 I do not believe any arbitrary restrictions should be placed on immigration, but only the best class should be sought, and some practical form of investigation and examination should be put into force to in-

sure against a class coming in unworthy of our great country.

In replying to question No. 4 I would say that this would depend largely on the conditions of the haul distance, and whether a return load could be counted upon, time saved, service to customers, etc.

Answering No. 5, I believe buying will have reached normal within a few months. It has increased very materially in the past two months, and I feel confident that this condition will grow till normal is reached. I am of the opinion that the equipment of factories was overdone during the past few years, and that it will be some time before demand will overtake production, on "generally speaking" all lines. "No," is my belief to question No. 6.

Question No. 7 is a somewhat complex one. It depends largely on the industry and the nature of its product. Generally speaking, it would be safe to say that about 50 per cent. of the production costs would be represented by labor or wages.

My reply to your question No. 1 would embrace No. 8 also. I do not feel that the home markets can keep our factories fully occupied at all times. We should seek foreign markets, especially for such natural products as pulp and paper, asbestos, nickel, etc.

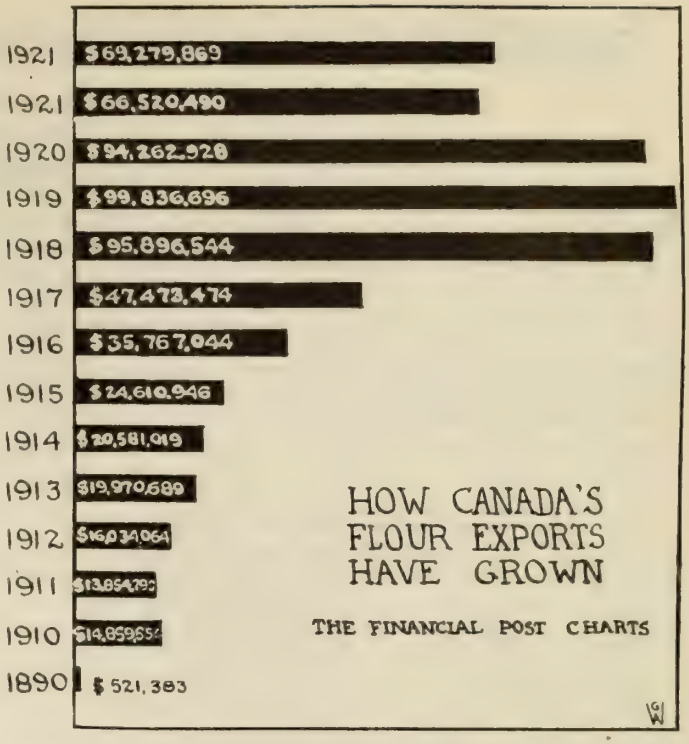
To question No. 9 I would say that the lowering of freights would certainly help business in a very marked way. The railways, in my opinion, will have to cut wages and otherwise bring down expenses in the same manner as industry. This will result in increased freight for them, which will generally benefit the country as a whole.

Answering the last question I believe that Canada can make no mistake in the development of her natural products, and thus bring into play the power of her latent wealth.

CANADA WILL HAVE TO EXPORT MORE

By W. INGLIS, President John Inglis Co.

YOUR questions are not easy to answer. In fact the very ones you ask me are some of the things we are trying to thresh out ourselves at the present time, and it is very hard to answer such questions when we do not know what is the best thing to do ourselves; but one thing is certain—Canada will have to export more, wages will have to come down, rents and living will have to come down, and railroad and water freight rates will have to be lowered before business will get back to anything like normal.



ECONOMIES CAN BE EFFECTED

No Trouble With Raw Material—Satisfactory Immigrants Only Should Be Obtained—Lower Transportation Needed

By C. H. WATEROUS, Waterous Engine Works

IN LOOKING over your questions I find many of them not easy to answer. However I will take them in the order in which you ask them. First, I believe that economies can be effected in some instances, probably very large ones, but individual factories would really have to answer the question for themselves.

We have had no trouble in securing raw material, and labor has not been difficult to handle. We have never tried profit sharing, and a bonus plan only to a limited extent. As our business has been quiet, especially for the last half of the year, it would be difficult to say that labor is more efficient than it was.

We should say that there should be no restrictions placed on satisfactory immigration, but care should be taken to keep out, as far as possible, undesirables of any nationality.

For a great many things, probably short distance haulage by trucks would be more satisfactory than by rail. It saves hauling to a railway and again delivery at destination, and delivery can probably be made in very much less time.

In our opinion, no factory can find out when buying will reach normal, and we should imagine it will be some time, after buying becomes normal, before factories will feel like investing very largely in new equipment.

We have an apprentice system, but have had a great deal of difficulty in getting apprentices for a number of years. This may now improve with improved conditions, but time can only tell that.

Relation of wages to production costs depends so much on the character of material produced that it is very difficult to answer this question. Even in our own lines it varies very considerably. It would appear as though the Canadian home markets at present were not sufficient to keep all industries employed. Export trade is very desirable, but it is somewhat troublesome to secure and keep. The best export trade for a new country like Canada, is to bring all the desirable people possible from abroad into Canada as settlers, you then really bring your buyers into your country where you have reasonable control of the business, instead of finding these customers in a foreign country, the markets for which you cannot control.

We believe there is no doubt but what lower transportation, both for freight and passengers, would be a very great help in reviving business.

Agricultural Implements Show Improvement

Power Machinery Has Become Considerable Factor During Last Decade—Crops Are Now Handled More Efficiently—Tractors Have Proved Their Usefulness—Credit to Canadian Industry

A GLANCE at conditions prevailing in agriculture discloses that there have been many improvements made in various kinds of implements during the last ten years; that power machinery has become a considerable factor in saving labor and that retail prices, while reaching their peak in the early part of 1921, have lowered a good deal during the latter half of the present year. Manufacturers of farm implements and harvesting machinery have found the domestic market decidedly restricted in its purchasing ability and for some time back have been either closed down temporarily or running at part time.

Many Improvements Made

There has been quite an advance made in many respects in the kind of implements manufactured and in their usefulness on the farm. As a result, grain and other crops are handled more efficiently and with less of the human element than formerly. For instance, the introduction of the tractor, the kerosene engine, the small thresher, headers, shockers, etc., are indicative of what has been done to facilitate and increase work on the soil. Laborers and farm hands have been growing rapidly less in numbers during the past fifteen years and the wages paid have accordingly gone up. Necessity has therefore urged numerous betterments in mechanical devices to make up requirements.

With regard to specific implements it may be said that binders have shown less improvement than some others. Certain equipment has been changed so that grain of all descriptions is being handled more efficiently than formerly but as a whole there has not been the marked advance in this machine as found in some of a simpler nature. Binders cutting an 8-foot swath share a larger proportion of the trade than they did ten years ago when the 7-foot machines were common. Mowers have likewise been developed in the same way. They have been made especially adaptable to take care of very difficult grass crops in the Northwest, notably Alberta and also on the marsh lands of New Brunswick and Nova Scotia.

Tractors are among the machines which have come considerably into use, the sale being quickened during the war when greater production was urged. A number of firms then engaged in manufacture here and importations from the United States were considerable. The most popular sizes were the 12-25 h.p., the 15-30 h.p. and the 8-16 h.p., the larger ones being used principally in the Northwest and on the larger farms of Eastern Canada. At the present time there is a steady but moderate sale which is expected to increase when agricultural conditions improve. Defects in make have been gradually overcome till to-day most of the tractors on the market are reliable. They have been made adaptable to belt power and many farmers use them for threshing, grinding feed, filling silos, etc., the lower h.p. in each case being the power developed as a traction machine and the higher h.p. being that from the pulley.

Along with tractors came a demand for the adaptation of many implements to be used with them. Often implements were found not to be strong enough for such purposes and consequently had to be strengthened in many parts. Thus the use of tractors had the effect of making a demand for larger capacity machines than had been used with horses. Especially was this the case in connection with drills, harrows, cultivators, plows, mowers and binders. Along with the above mentioned adaptations it was found necessary to equip all implements with self-raising or power-raising devices. This applied particularly to plows, cultivators, disc harrows and drills.

Improvements In Other Lines

Among other lines is the fertilizer drill for sowing grain and grass seed. During the past few years an attachment consisting of an additional box for holding fertilizer, so that it may be sown along with the grain, has come into play. Export business has demanded these things for many years but they are now coming into general service in Canada.

To lessen the toil of loading hay in the field onto wagons, two types of hay loaders have been fully developed. These great labor savers work efficiently. They are in use everywhere even where acreage is small.

The side rake and tedder is a combination which has also become popular. Formerly a dump rake was employed and, when occasion demanded, tedding was done by a separate machine. Now the combination machine permits separate or combined use. It has proved to be of great advantage to the farming community because of its adaptability.

Ten years ago the raising of corn was not very general in Canada, but the acreage has been increased yearly. The machinery for handling this crop has kept pace with demands. Reliable corn planters, corn cultivators and corn binders are made in sufficient numbers to meet the trade.

During late years the stiff toothed cultivator has come

Showing the Value of the Tractor on the Modern Farm.

into prominence, principally for cultivating summer fallow and for the stubble fields of the Northwest. Previously the spring tooth machine was popular. Potato diggers are other machines which have seen considerable development, as a result of constant demand for reliable implements to do this work.

Betterments in Harvest Equipment

Similarly there have been striking advances made in threshing machinery. The old threshing bee, so well known to older people, has found itself displaced in many districts by small threshing machines, suitable for the work of one large or two or three small farms. By the changed method vexatious delays, such as were often experienced under the old syndicate system, are eliminated.

Headers and shockers are among improved equipment supplies. In some parts of the Northwest, particularly in southwestern Saskatchewan and southeastern Alberta, the former has come into general service. It has been found that headers do their work economically. While their adaptation in Canada has been of comparatively recent date, they have been highly developed and widely used in other countries, notably the Argentine Republic. Shockers have not yet got out of the experimental class. Many kinds have been tried but thus far it is claimed their economic merit is rather doubtful. Many minds have been working to effect improvements and if machines of undoubted efficiency could be made their utility would be welcomed in the large wheat fields of the Northwest.

With respect to plows not much has been added to their design except that the heavier models have been adapted for use with tractors. Combustion engines, developed to run entirely with kerosene, have been a development consequent of the high price of gasoline. The gasoline engine of from 1½ to 8 h.p. which came into the place of the windmill on many farms has in turn been supplanted by the machine which will use the cheaper fuel.

Credit to Canadian Industry

During the past few years there has been developed and manufactured in considerable quantities in Canada a combined reaper-thresher. This machine not only cuts the grain, but cleans it, threshes it and puts it into bags ready for the market. In the history of the agricultural implement trade no other machine it is said has equalled this for economy in the handling of grain. It cannot be used in Canada, but is the chief implement for reaping the grain in countries where the grain can be left to ripen on the stalk, such as Australia, Argentina, Algiers, etc. Considerable quantities of these labor-saving and grain-saving machines have been exported from Canada to the countries named, where it is acknowledged that the Canadian-made implement is superior to any on the market.

The Barometer of Trade

Discussing the production and merchandising phases it is remarked that no changes in retail prices of implements in Canada were made during the early part of the war. Cost of labor and material then were low. Even after they advanced the manufacturers maintained the lower production quotations. Gradually, however, retail prices advanced year by year till 1921 saw the highest figures yet reached. Sales of Canadian-made implements were large till the low level of about a 40 per cent. business was done. High prices for the implements and low returns for all kinds of farm produce were responsible.

Notwithstanding the scarcity of labor and difficulty in getting supplies of raw materials during the last two years of the war, the output of Canadian implement factories was well sustained. Domestic trade was well taken care of and some export business was done, showing the ability of Canadian plants to meet all home trade demands with the exception of tractors. Soon these machines will be built, too, in quite sufficient numbers in our own country.

Trend Slowly Toward Better Industrial Conditions

ACCORDING to information coming from responsible sources, trade and industrial conditions are slowly improving in Canada, Britain and the United States. The process is slow but positive. Pronouncements have been made by men of recognized standing in the Republic showing that the trend of events there is upward, though no marked evidence of improvement is looked for much before March next. In Canada the external trade records show a gratifying betterment, the balance for November being most substantial, almost enough, in fact, to wipe out the adverse balance accumulated during the spring and summer months.

Furthermore, in this connection British Government Trade Commissioner Field who within the last few days completed an extensive tour of Ontario to get facts from captains of business and industry, has reached the opinion that the worst of the depression is over and better things may be expected. Reports reaching him from Britain also indicate that broadly the industrial situation there has taken a turn for the better. Progress is slow, but it is certain. For the year coming it would seem there will be much more room for the hustling optimist than the grumpy pessimist.

Ten Years Progress in Wood Working Industry

Development Comprises Many Lines Such as Furniture, Pianos, Phonographs, Sash, Doors, Interior Woodwork for Buildings, etc. —Improvements to Machine Design and Manufacturing Methods

By W. A. MARSHALL

THE woodworking industry comprises many different lines, such as furniture, pianos, phonographs, sush, doors, interior woodwork for buildings, etc. While manufacturing processes are not exactly the same in each there is enough similarity in methods and equipment to discuss progress under a general heading. Looking back over the past ten years the most outstanding development is seen in the manufacture of phonographs.

This industry is distinctly an achievement of the decade just gone. During the last three or four years the demand for these instruments was so great that manufacturers had to check up production methods carefully to see where they could increase output. As a result many short-cuts were discovered and much new equipment installed. Today woodworking operations in the larger phonograph factories are on such an efficient basis as to be an example for other wood producing plants.

Neither has furniture manufacturing been at a standstill. There have been some new plants erected and many additions made to those existing. The manufacturers wisely formed an association six or seven years ago. Through it a great deal of progress has been made in installing efficient cost systems. It has also been helpful along other lines, through elimination of destructive competition, promotion of national advertising campaigns and in creating good-will in the trade. On the whole the industry is on a much more stable basis, and there is a better tone to it than formerly.

Advance in Many Branches

The same is true of the sash and door and interior woodworking plants, in fact of all branches of woodworking. Realizing that accurate cost records must be kept and that practical systems must be put into effect to provide these records, there have been inaugurated important changes in manufacturing methods.

First in importance, I think, comes the development of kilns for drying lumber. The immense acreages of lumber that used to surround the average plant manufacturing wood products are no more to be seen unless the owner happens to be conducting a lumber merchant's business as well, or unless he has failed to install a modern dry-kiln.

Several types of dry-kilns are on the market, all good. The feature which distinguishes them from the old type, which was really nothing more than a hotbox, is that lumber can be taken green as received from the sawmill or from the lumber company's storage yard and thoroughly seasoned for use in from ten days to two weeks. The time depends on the kind of wood, whether of a porous nature or otherwise, and the amount of moisture contained. Volumes have been written by experts on lumber drying but in a general way the modern method consists of turning live steam into the chamber containing the lumber, saturating it up to a certain point and then drawing off all of the moisture by successive degrees of heat treatment and proper air circulation.

This rapid process makes it unnecessary for the manufacturer to stock the quantity of lumber he was obliged to carry when it had to be air dried, or yard seasoned. He can better anticipate his requirements and does not have to tie up so much money.

Lumber Handling Facilities

Facilities for handling lumber after it has been unloaded from the railway cars have also been much improved. Local systems of trackage and cars have eliminated a good deal of piling and repiling that formerly involved great expense for labor. In some up-to-the-minute plants lumber is piled directly from the railway cars on to yard cars and allowed to remain there till dried. It is then rolled into the dry-kiln at one side, out the other, dry, and into the plant, not being unloaded until it is removed by the workmen at the saws to be cut up for manufacturing purposes.

In the plant proper straight line production has been greatly assisted by the introduction of electric motors. Numerous woodworking factories throughout Canada use individual drives. This type permits machines to be set in any position. This cannot be done when the power is taken from line-shafts. Straight line production is considerably harder to achieve in a woodworking plant than in the average metal making and for this reason:—stock feeds through the machine from front to back. On an iron planer the metal to be planed is secured to the bed and is planed by the heads travelling back and forth. When the job is finished the stock is removed at the point where it was put in the machine.

Advantages obtained in the placing of machines by the use of individual motor drives, either direct connected or operated with short belts, are therefore great. Builders of woodworking machinery have during recent years made commendable strides in developing the directly connected motor. Machines like moulders, double-end tenoners, continuous feed glue jointers, etc., completely motor driven are now obtainable. Some of these machines have as many as five motors direct connected to the spindles or feed mechanisms. The machines are perfectly self-contained except for the wire that transmits the "juice." They can be placed in any position desirable for continuous routing.

Ball Bearings a Feature

Ball-bearings are another feature of modern woodworking equipment. Experiments with these have been conducted over the last ten or twelve years until now the manufacturer who buys a woodworking machine equipped with ball-bearings, and they are available for a great many operations, need have no fear of getting a trouble maker. Cutters in woodworking machines must revolve at tremendous speed to do good work. That is why ball-bearings have been so widely adopted.

Take, for instance, on a shaper. The spindles on ball-bearing shapers can be, and are, run at speeds varying from seven thousand to ten thousand R.P.M. The result is almost perfect work, needing very little sandpapering to give a surface smooth enough for varnish. With the old shapers, running at comparatively slow speeds, around 3000 to 3,500 R.P.M. perfectly smooth work could not be produced. The knife marks were plainly visible and had to be removed by sandpaper. This meant hard labor and it cost money.

Another advance worth while has been made in planers. The old type planer had a cylinder carrying two knives. To produce good smooth work, which meant having the knife marks close together, the machine had to be operated at slow feed. If the operator attempted to speed up he only succeeded in producing lumber with a surface like a wash-board. Increased speed simply meant so many more knife marks per inch. With the old machine knives when dull had to be removed to be ground.

The planer of the last few years has many improvements. It has a cylinder carrying three or four knives as required. It has an electrically driven grinding attachment mounted on the machine. Then, to insure all four knives cutting accurately, the machine is provided with a jointing attachment for jointing the knives to a true cutting circle.

The I. T. S. Rubber Co., 26 Alpine Avenue, Toronto, Ont., will build an addition to its tire plant to cost about $60,000. W. Jefferies is superintendent.

Decade of Progress In U. S. Steel Industry

Capacity Has More Than Doubled in Ten Years—Prices From 1911 on Steel Bars — Plates — Black and Galvanized Sheets— Foundry Pig Iron—Coke—and Bessemer Steel Billets

By B. E. V. LUTY, Pittsburgh Correspondent of Canadian Machinery

TEN years ago the steel industry of the United States had a steel ingot producing capacity of about 26,000,000 gross tons a year. To-day it has a capacity, as commonly estimated, of about 52,500,000 tons, so that the industry has doubled, in point of tonnage, in ten years. From the earliest time up to 1908, when there was a serious backset, the pig iron production of the United States had a habit of doubling, on an average, about every ten years. Inasmuch as steel supplanted iron, becoming the dominant rolled material early in the decade of the eighteen nineties, its production increased more rapidly than by a doubling every ten years, to 1908. The prospect then was that the rate of increase thereafter would be moderate, but the war changed this.

It should be noted that while capacity for producing steel ingots and castings doubled from 1911 to 1921, pig iron capacity did not, having increased from about 28,000,000 tons to about 45,000,000 tons. The smaller proportionate increase was due chiefly to the fact that the needs of the iron foundries did not increase as rapidly as the needs of the steel works. The foregoing references are to capacity not actual production, for the entire productive capacity now existing has never been fully engaged, the highest annual outputs have been made as long ago as in 1916 in pig iron and in 1917 in steel ingots and castings.

At the beginning of 1912, ten years ago, the iron and steel industry of the United States had just begun to revive after a period of slight depression. Demand increased steadily in 1912, while prices rose until October or November. Then the brakes were set on prices by leading manufacturers, for fear of a runaway and disturbance to the market, and things ran along smoothly until late in 1913, when there occurred a decided slump in demand. There was a good volume of new construction in 1912 and 1913, equally of steel works and of plants for the fabrication and working up of steel.

In the fore part of 1914 the steel industry of the United States was in a state of severe depression, involving producers and consumers alike. In July of that year there were definite indications that a revival of some proportions was setting in. The inception of the world war the next month plunged the industry into deeper depression. During the closing months of 1914 the question men so often ask each other, "How's business?" was replaced by the question, "How long do you think the war will last?" There was no business, so that it was not worth while to ask how it was, and the common thought was that there could be no good business during the war.

* Independents' market; Steel Corporation price remained 38.50 until about Sept. 1, 1920, when it became 43.50.

Ten-year, pre-war average, 1904-1913, 24.83.

that would naturally exist as long as the war lasted.

In June, 1915, the Brier Hill Steel Company, Youngstown, O., announced that it would build an additional open-hearth, furnace and the announcement was hailed as something remarkable, the resumption of steel works building. Afterwards open-hearth furnaces were built in blocks of six, eight or more. In August the trade awoke to the fact that the steel mills were practically filled with orders, and nearly everyone was surprised. These recollections are very vivid in the mind of the writer because the views then entertained seem so strange in the light of what happened afterwards.

Early in January, 1916, Chairman Gary of the United States Steel Corporation gave an interview to the press, in which he said that prices were advancing too rapidly, and gave counsel, "Stop, look and listen." Events showed that prices had only begun to advance. At that time they were just level with the prices attained in 1907, prices which had not been reached at any time since, but from that time on they almost tripled, being in July, 1917, almost three times the top prices between 1903 and 1916. Then, with the United States Government's war control impending, prices began to recede a trifle, the control, by an agreement between the War Industries Board and the manufacturers, becoming effective later in the year.

A composite finished steel, or weighted average of the important products, shapes, plates, bars, wire, pipe, sheets and tin plate, compiled by the writer gives in a nutshell a general comparison of finished steel prices in the United States, as follows:

TEN-YEAR AVERAGE

1904-1913	1.80
1913 average	1.72
Low, Dec. 31, 1914	1.42
High, July, 1917	5.80
Government Control	3.80
Industrial Board adjustment, March 21, 1919	3.25
High, 1920	3.80
Dec. 31, 1921	2.25

Thus present prices are very high.

During the latter part of the war widely divergent views were held as to the future of steel, after the war. Some expected a great period of construction activity, requiring immense quantities of steel. Others expected a period of several years of depression. Neither view was really correct. The desire to build, to expand, was present, but the circumstances were unpropitious. Costs were too high and trade was disjointed. The compromise was a period of inflation, in 1920, when business seemed to be booming but was transacted under such difficulties and at such high cost, and left so much costly material to be liquidated, that the business turned out to be not nearly as profitable as it had appeared to be. The year 1921 had to be devoted to readjustment.

It is perfectly plain, from a survey of what has occurred in recent years, and a careful consideration of what has actually been occurring in the closing months of 1921, that 1922 is going to be a year of very decided activity, taking industry and commerce as a whole. Those who do not hold this view are thinking of particular industries, which may not be as active as industry in gen-

eral, or are thinking in terms of large profits, when profits are likely to be relatively small, and gained with difficulty, by hard work and the use of the most modern and efficient appliances and methods.

When in August and September of 1921, the talk about "unemployment" was at its height, it turned out that the proportion of men unemployed was not so large after all, while those who were in employment were working much harder, individually, than in 1920. The physical volume of business in the United States was large. Throughout 1921 the volume of "bank debits" (debits to individual accounts at banks) showed a lag of only 15 to 20 per cent. below those of 1920, whereas the declines in prices and reductions in wages and salaries would account for a larger decrease than that. This may seem strange, crease than that. This may seem strange, but the figures are indubitable. The activity was of quite a different sort.

It is one thing to expect full industrial activity in the United States in general, and another thing to expect full employment for the entire steel producing capacity. The census report shows that the number of persons gainfully employed in the United States increased by 9 per cent. from 1910 to 1920. The steel producing capacity has doubled since 1910. Evidently there is a chance for everybody to be at work without the entire steel making industry being fully employed. The machine shops, agricultural implement factories, railroads, automoblie shops, sheet metal shops and the like can all be busy without the steel making industry being fully employed.

Worst is Over in Engineering Industry—Slow Recovery Made

IT IS NOW more or less generally felt that for the engineering industries, as for some of the others, the worst of the depression is over and a slow recovery is being made. In several sections of the industry orders are now coming in more freely, and although it is true that considerable unemployment still exists, various factors, such as the easier financial position, the reduction in prices that has taken place over the last few months, and the extension of the Exports Credit Scheme, are likely to increase the feeling of restrained optimism which now exists. Prices are firm, and in most coses no further fall is experted. On the contrary, as quotations have in some cases been made somewhat below cost, a slightly improved tone in the market is likely to lead to a hardening of prices to a slightly higher basis than at present; buyers are, therefore, urged not to delay the further placing of their orders for machinery and engineering products." This statement was made to Canadian Machinery by F. W. Field, H. M. Trade Commissioner, Department of Oversea's Trade at Toronto.

"Another factor tending to have the same effect," continued Mr. Field, "is the progressive increase in the price of Continental materials and the undoubted increases which will take place in the future. The order books of Continental firms are now approaching completion, and sellers as well as buyers are unwilling to accept distant deiveries with the prospect of increase in cost before delivery is effected. On the best authority, therefore, it would appear that no advantage can be anticipated by the further withholding of orders.

"Orders are specially anticipated in the next few months, in connection with the further recovery of industry, in all parts of the world. In case, the following industrial plant is likely to be wanted on a larger scale than hitherto:—Steam engines, pumps, machine tools, woodworking machinery, coffee machinery, rice machinery, mining machinery, transporting machinery, agricultural machinery, textile machinery, rubber machinery, oil extraction plant and other produce treating machinery.

"These trades have, of course, suffered worst during the depression, not because the goods were not wanted, but because, generally spaking, the buyers could not offer to pay quickly for their goods. The interval has been utilized by the manufacturers to develop their methods and their products, so that the buyers, who are now coming along, will have improved materials, even though the prices in their own currency may seem large.

As an instance, the question of coffee machinery was recently considered. Owing to the over production of coffee and the difficulty of placing it on the market it was impossible during 1921 to sell coffee machinery in any large quantities. At the same time, a number of would-be purchasers overseas sent particulars of alleged improvements on the Britih manufactures, and comparison of British designs with the best foreign competitive lines were made. In many cases it was found that the overseas product, where not merely a copy of the British machine, had differences which could not be called improvements, as in most cases they had already been tried and rejected by British manufacturers. The continuous improvement, which normally takes place in connection with the industry of coffee-making machinery, has undoubtedly been quickened through the depression, and this recent survey has been most convincing in showing that British coffee machinery has nothing to fear by comparison with the products of other countries.

Canadian external trade for the month of November showed a continued trend toward favorable totals. The balance in favor of exports was indeed substantial, almost sufficient, in fact, to wipe out the adverse balance which was piled up in the spring and summer. For the month mentioned imports reached a value of $64,271,434 and exports $86,533,862 as compared with imports of $98,671,116 and exports of $147,508,002 in November 1920. For the eight months ending November 1921, imports were $502,521,047 and exports were $502,152,675.

The Year 1921 Has Been Great Clean-Up Period

Manufacturers, Wholesalers and Dealers End the Year With Clean Stocks—Trade Will Reflect Consumer Demand and Consumer Demand Somewhat Depends on World Conditions—An Altered Buying Policy

By E. DEWITT HUTT, Editor Dry Goods Review and Men's Wear Review

BUSINESS records will probably show that the year 1921 was the great "clean-up" year for manufacturers and dealers in men's wear and dry goods lines. No matter what the year 1922 may have to write on its unrevealed pages of history, it can safely be assumed that it starts out with clean stocks—generally speaking—and that the volume of business will be quickly reflected in the trading that goes on between the dealer and manufacturer or wholesaler as the case may be. Conditions that are world-wide rather than strictly Canadian in their aspect will, in a large measure, govern the consumer demand during 1922. We are no longer an isolated people, self-contained and self-containing; we are an integral part of the comity of nations. It makes a difference, after all, whether the volume of the world's business seeks its ordinary channels, or whether its progress is interfered with by revolution here and there, unstable conditions somewhere else, and hardship and even stark famine in another quarter of the globe. The world's business to-day is so international and inter-dependent that the buying power of the average Canadian consumer is, in a measure, governed thereby. Some of our basic products, such as wheat, are price-fixed by world markets. The cost of producing wheat in Alberta or Saskatchewan or Manitoba has little or nothing to do with the price of wheat in Winnipeg; wheat is a world commodity and its price a world price. And the price received by the western farmer for his wheat is the dominating factor in his buying power, and the buying power of the west is, in turn, a dominating factor in the progress of Canadian business. In taking a peep, therefore, into the year upon which we are soon to enter it is well to bear this in mind. It is not mere foolish patriotism and claptrap to say that Canada, at this time, is the most favored country in the world. We believe it to be literally true; the statement can be verified by every returning traveler from any country in the world. At the same time, let us not forget that normal times in this country depend upon normal times in many other countries. If there is any consolation ever in the fact that one's neighbor is worse off than one's self, then Canada has abundant cause for consolation and can pass into the year 1922 with a light and confident step.

January 1921

January, 1921, commenced for the men's wear and dry goods dealer, with heavy stocks, a considerable proportion of which was high-priced merchandise. A good deal of apprehension prevailed in many quarters. A very trying time had just been passed through on account of the luxury tax which had been removed only a few days before Christmas Day of 1920. The baneful effects of this tax were still casting a shadow over the in-coming year. The public, urged on by a superficial press, were demanding lower prices, lower than were justified, having regard to a safe and sane readjustment.

Decline on Its Way

By this time, however, the decline was well on its way so far as its certainty was concerned. World conditions established the fact that it had to come. Over-burdened countries that had engaged in the war were already incapable of entering the world's markets for their legitimate requirements, and the succeeding twelve months have not alleviated their condition in this respect. Many of the leading Canadian wholesale and retail firms had already taken heavy losses on their merchandise and were straightway operating on a replacement value basis. But it is safe to say that the great bulk of the retail trade did not start to cut on their merchandise till January 1921. It was but natural that the trade "get from under" with as little loss as possible; and who shall say that it has not been better for the financial stability of this country that the decline has spread over a considerable period and that the shock has been absorbed rather than taken all at once? The records go to show that the number of failures has been much smaller than was expected in the early part of the year.

The Clean-up Begins

Speaking for the bulk of the trade, the great clean-up began in January of the year now drawing to a close. Sales were the order of the day from coast to coast and radical price-cutting was seen in many quarters. An altered buying policy was very noticeable; in fact, there had been evidences of this even before the turn of the year. Some of the most progressive houses began operating on a thirty days' basis; others on a sixty. The agitation for a four-season buying policy was swallowed up in practice—dealers began to buy not four times a year but some of them as often a month. The "hand to mouth" policy has now become pretty well an established policy with most buyers; in some cases, it might be pointed out, to the detriment and loss of prestige of their own house. Sales have been lost because commitments have not been made on certain lines of merchandise that have reached a fairly stable basis. It is safe to assume, however, that a careful buying policy will be followed for many months yet.

Stocks Now Clean

There is a unanimity of opinion from many quarters now that stocks all over the country are well cleaned up. The Financial Post recently sent out a questionnaire to hundreds of bank managers all over the country asking them about the conditions of stocks in their respective communities. Their answers have all been to the same end—that stocks are clean. Not a few managers state that these stocks are lower than they have been in many years. Our actual contact with retailers all over the country confirms this unanimous opinion of bank managers. The number of small orders that keep pouring into wholesale houses week after week from all sections of the country is a clear indication of the condition of stocks. It appears to us that this is a hopeful omen for the coming year's business. Whereas January, 1921, began with heavy stocks and the grim necessity of liquidating them on a declining market with consequent losses, January, 1922, will begin with clean stocks and fairly stable markets, and a chance to merchandise stocks with fair profits in sight.

THE MATHEWS CAR UNLOADER

The Mathews Gravity Co., Port Hope, have marketed a car unloader, the latest addition to their line of conveying equipment. The new machine is of solid steel construction throughout, and special consideration has been given to the importance of absolute rigidity, balance and portability, protection of bearing and bushings from coal dust, sturdy adaptability to speed under hard usage, and general fool proofness. It is built in two sizes, one having a length of 17 ft., 6 ins., 12 in. rubber carrying belt, and the other 20 feet with 16 inches rubber belt. A two horsepower electric motor is used, or where preferable a gasoline engine may be adapted. The wheels are 48 inches. Tests of the unloader in actual use have shown very satisfactory service.

Credit is a Vital Force in Modern Business

Credit A Vital Force in Business Transactions—What Would Happen Were Credit to Stop — Where and How is Credit Data Obtained—Commercial and Trade Agencies as a Reliable Source

By WILFRED G. ASTLE

CREDIT is a most vital force in all modern business transactions. It has grown to such an extent that practically all business transactions are done by credit. People of the country are conducting their business almost upon faith as to the solvency and belief in the integrity and honesty of the individuals or corporations with whom they are dealing. This goes to prove that credit, from the standpoint of successful business management, is a subject of tremendous importance.

The word credit comes from "credo" and every transaction performed by credit involves the belief on the part of one man in the integrity and character of another man. What is credit anyway? It is one of the biggest forces in the modern business world. It consists of all the stocks and bonds dealt in on the world's stock exchanges; all the world's huge national and state debts; all the tremendous international trade balances, one way or another; all the bills and accounts receivable on all the ledgers in the world; and very nearly all of what is called money in the world. All these things are only different forms and expressions of that wonderful thing which we call "Credit." It will start enterprises, build railroads, make civilization, wage wars, and do all sorts of things.

Suppose for a moment that all credit was stopped and suddenly removed from the modern business world. What do you think would be the result? Any attempt to do such a thing would instantly result in chaos. All the gigantic wheels of the world's commerce would instantly come to an absolute standstill; indescribable misery would suddenly seize upon the entire civilized world, and man would rapidly lapse into a state of barbarism. Think on these things. What would we do without railways, electricity, the printing press, and all the other numerous things? The loss of these things, much as we need them, would be nothing compared with the loss of credit. All the gold in the world would not be enough to settle the daily clearings of business.

The Credit Department of a Business

The credit department in a modern business organization must have three essentials. The first of these is the obtaining of reliable credit data concerning every customer on the books of the concern and all who are likely to become customers. Second, this information must be filed and recorded in such a manner that it will be on hand when it is needed. The third requires that the credit manager use this information intelligently when passing on a credit risk.

Where, and how, is the credit data obtained? There are quite a number of sources. For instances, you can secure this information from commercial and trade agencies; Dun's and Bradstreet's rating books; exchange information with other creditors; from your own salesmen; from statements submitted by customers; credit leagues and trade associations; newspaper items and general rumors, and from your own books—records of previous experience.

A prominent banker, speaking before a recent meeting of the National Association of Credit Men, gave two reasons why requests for credit information addressed to banks do not bring forth more satisfactory response. First, they were not properly made out, and second, that the source of information is sometimes betrayed. If the credit manager will ask any modern bank, telling them exactly what he wants, why he wants it, and give some reasonable basis on which to work the bank will make every effort to secure it for him. It is better to give your request to one bank and trust it to supply the information. What the bank fears most of all, is the failure of some concerns to observe the sanctity of credit information. This betrayal of information and its source has caused bankers to adopt the most trustworthy method of safeguarding it, and that is, closing the channels to a man who abuses its sanctity.

Commercial and Trade Agencies as a Reliable Source

The use of commercial and trade agencies as sources of credit information, is very reliable, and is increasing. Their usefulness and efficiency, however, depends largely upon the co-operation of the business men, because they are built upon the findings of investigators and the information furnished by credit departments. These agencies are exceptionally well qualified to obtain information which is of great service to their subscribers and which is not readily available from any other source The antecedents of an individual, co-partners or officers of a corporation can be gone into very thoroughly by investigators of the agencies to bring out especially what had been the previous records, commercial or otherwise, of the people reported upon. and how they were regarded for fairness and integrity. The value of this source of information demands of each participant absolute fairness and readiness to furnish any information that may legitimately be asked for. To be successful it must have the wholehearted co-operation of all.

"Exchanging credit information with other creditors," says the 'Business Progress Bulletin,' "has proved of such value that to-day the majority of credit men consider it the best means of securing information about present and prospective customers."

"The time is past when business men have felt that, in furnishing a competitor with this information, they were exposing business secrets and that the mention of the customers name meant the possible loss of an account. The standard of commercial ethics has been considerably raised during the past generation and to-day sources of credit information as well as the facts furnished are considered sacred. This condition has made a modern man realize that, in exchanging experiences with his competitor, he receives far more than he gives. It is mistake for any credit man to expect to receive credit information without making a definite statement of his own experience with the person inquired about when he makes his initial request."

The bulletin further states that "there are two ways of acquiring the name and address of other concerns selling a particular customer, if you are not a member of a credit interchange bureau. The first is from the list of references furnished by the customer himself; the second from the list of sellers secured by the salesman after hastily surveying the stock on the shelves of the prospect. The first method if unsupported by other information is probably the weakest foundation upon which to establish a credit foundation. But the fact that this is true does not reflect unfavorably upon the buyer or seller referred to. It is due, however, to the fact that unless the merchant maintains a reasonably satisfactory credit relation with some sources of supply he cannot stay in business and it is perfectly natural for him to furnish as references those houses with whom his credit dealings bear the closest scrutiny. The second method is a far better source of information, but it is limited to those classes of goods which are easily identified. Furthermore, there is apt to be difficuty in ascertaining whether they were purchased direct from the manufacturer or through a wholesaler or jobber."

The Credit Interchange Bureau

The Credit Interchange Bureau, fostered by the National Association of Credit Men, has great possibilities for getting credit information. It is not intended to be a substitute for the services rendered by the mercantile agencies which are useful in supplying information as shown in a previous section of this article, but among the ad-

vantages of the bureau are the following:—

Information concerning accounts which have been discontinued or have been paid when due.

It gives a knowledge of all merchants who are overbuying or buying through new channels.

You do not have to ask a customer for references, but you secure the experience of others and preferred references.

The source of information is confidential. Members make reports on customers and are known by number and not by name.

By using this service you can eliminate all undesirable customers.

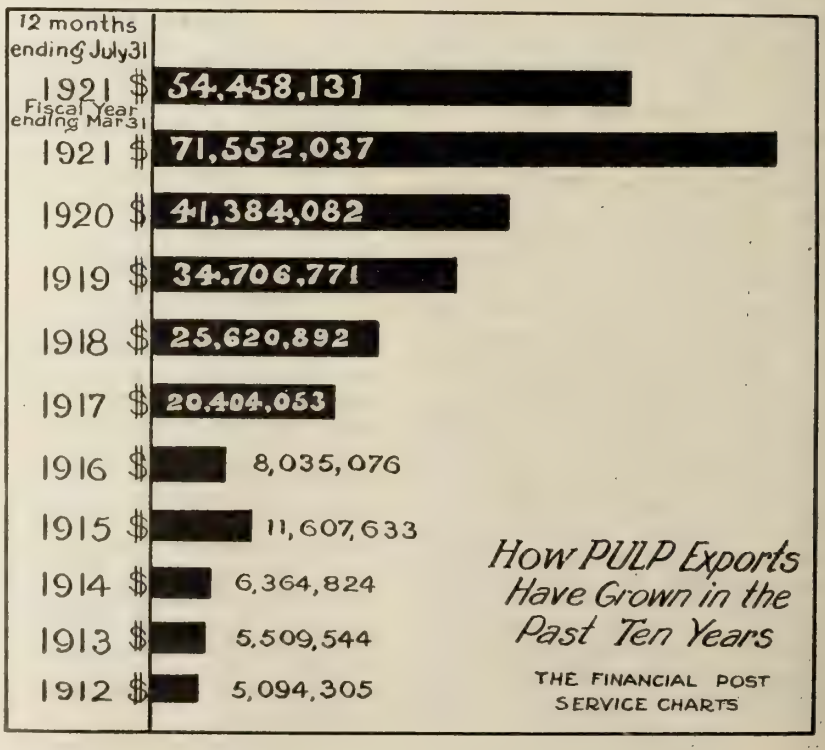
All information is taken from live ledger accounts, therefore, it is dependable and reliable.

Factors of Credit

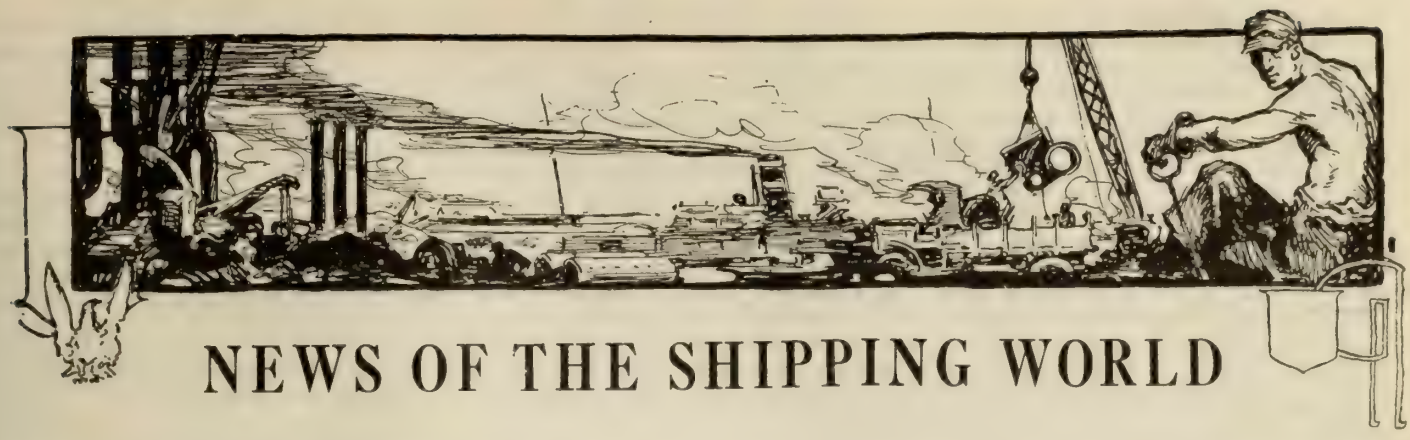
Leading authorities on the subject of credit place the factors which determine the credit risk in two classes. The man himself and the business. Under the first heading is considered the business morals of the debtor and his ability in, and familiarity with, the business in which he is engaged. The second heading—the business—is considered from the financial standpoint, divided as to assets and liabilities, and the profits or losses made in its operation.

As to the relative importance of these two factors—the man and the business—the authorities differ. Mr. E. St. Elmo Lewis, in his book on credits, takes the stand that the man—his character—should be considered secondary, and says:—

"If goods are the basis of all credit, character of the owner is and should be an after consideration. The very first question any credit man should ask, is, can he pay? The question of a man's ability to pay is becoming of greater ease of solution. The question of the intention or inclination to pay must always be shrouded in the nebulae of psychological theory. What is the applicant worth? is the crucial test. Then we shall test him by another. What sort of a man is he? Do we buy a law suit when we sell him goods? How much must we add for moral insurance against loss? Character is of vital importance in small concerns; of vital importance in concerns doing a large business on small capital, and it becomes of less importance as we progress into the field of corporations."



In direct contrast to the above contention are the views of Ernest Reckitt, as expressed in an address delivered before an organization of bank clerks. After naming the factors to be considered by the banker extending credit, he said:—"You will note that in enumerating these factors I place first, and purposely so, 'The Man Himself,' and I believe I am correct in stating that bankers are now placing more stress upon this point than ever before. The man of good character and intelligence, who is full of energy and perseverance, will not find it difficult to obtain a reasonable line of credit with his bankers, while the man who is deficient in these qualities, whatever his reputed wealth may be, will be looked upon with suspicion. It therefore behooves you to become students of human character as well as students of banking, if you are to fill the highest positions within your reach."



Without attempting to decide the relative importance of these factors, it can safely be stated that one of the first steps to be taken by the credit manager is to secure a financial statement from the applicant. The character of the statement might serve as a guide in determining the character of the man with which he has to deal. Never look a a debtor's quick assets and contrast them with his debts without looking very carefully at his character and qualifications for success. Make the debtor know and feel that honesty, integrity, industry, and good habits are part of his capital and strengthen his chances for credits, just as the reverse of these characteristics would injure his credit.

Credit is based upon confidence. This makes it necessary for all credit managers to constantly seek for reasons upon which to base this confidence. His strength is in his knowledge. He is the final conservator of the business. Others may be profit-makers, but the credit manager is the profit-saver in every commercial organization. The test of his success is measured by the average annual losses, the accounts receivable measured by the average number of days' sales contained in them; the average percentage of discounts, based upon receipts, and the general office expenses, if he has the management of the office in charge.

The credit manager needs three distinct characteristics in dealing with purely credit functions. First, a wide and general knowledge of business methods and business conditions, second, a keen insight and analytical mind. Third, tact in its broadest possible sense. The best credit manager is the one who will approve the largest percentage of orders and still keep his percentages of loss down to a fair average. One man might refuse half the orders which come to his house, while another would accept ninety per cent. of them, and both show the same percentage of loss. Who would be the best man? The ninety per cent. man, of course, because he certainly would be the more valuable man. A good first-class credit manager is an aid to the salesman. He does not try to find a good reason to decline an order. He always takes the opposite view and exhausts every resource at his command before rejecting an order. His duty is to be constantly on his guard. Always on the lookout for the slightest sign of danger. Always ready to take prompt and vigorous action to avert disaster to his concern, or to lend a helping hand to a customer.

English shoe manufacturers are said to be preparing to make sport shoes with raw-rubber soles, since it was discovered by tennis players on Far Eastern rubber plantations that the crepe or raw-rubber soles, lasted longer than those of the vulcanized variety, and were much more pliable. Rubber soles as commonly seen on different kinds of footwear, have usually undergone the vulcanizing process. It is thought that the new soles can be made to sell as cheap as the vulcanized article, even though made of pure rubber.

NEWS OF THE SHIPPING WORLD

THE LATE Glen liner "Glenapp" has now been completed after considerable alterations for her new owners, the Elder Dempster Line. From being a motor cargo vessel, she has been converted to the first motor passenger liner not only of the Elder Dempster fleet, but of any other. She has accommodation for 225 first and 140 second and third class passengers, and the saloons, cabins and staterooms are comfortable in the extreme. The West African trade is one of those where the same passengers to a large extent are carried a good many times in the course of a few years, and the average west coaster is an individual who appreciates all the comfort he can get. The exigencies of the climate force the residents to make frequent trips home for rest and recuperation, and they develop very strong likes and dislikes for particular ships and the personnel of those ships. The converted vessel has been christened the "Aba," a name well-known in the West African line, and she is expected to achieve a considerable amount of popularity among travellers between England and the coast. There is also an extensive trade at certain times of the year between Liverpool and Las Palmas, and Madeira, which are calling ports for the West African liners on their way out and home, and the people using the Elder Dempster line for this trip look for a high standard of comfort. This it has been the aim of the new owners to furnish.

* * * *

IT IS UNDERSTOOD that the United States Shipping Board, through their representative, Mr. Love, and Sir Ernest Raeburn, acting for the British lines, have reached an agreement in the controversy over the carriage of Egyptian cotton. The agreement has not yet been ratified at the time of writing this, but there is every probability that principals will ratify the agreement reached by the negotiators. Sir Frederick Lewis, speaking at the annual meeting of the Prince Line, alluded to the competition of the U. S. Shipping Board fleet, and recognized it as a competitor, but was not disposed to either belittle or magnify its possibilities. He saw no reason with goodwill and breadth of vision on both sides why the competition could not be carried on with fairness to both.

* * * *

THE VIEW of the shipping situation held by certain people in Germany it well illustrated by the following extract from a German newspaper, reprinted in "Syren and Shipping," London. It shows that the feelings of at least some of the German people are not those of resignation or repentance. The passage quoted is as follows: "The industrial expansion of Germany constituted in the eyes of our chief and most envious rival, namely England, a just cause for making war upon us, our enemy's object being to render German industry, and especially German ocean shipping, incapable of further competition. It was this envy that was the whole motive and driving force of the war. This is a fact which is emphasized in every line of the disgraceful peace treaty of Versailles and of the London ultimatum. But, badly hit though German shipping has been through the war that was forced upon us, it has not been destroyed, nor has German shipbuilding either. Already the ships of which we have been robbed are being bought back by German shipowners; new ships are on the stocks in German yards; they are rapidly being launched and plough the waves under the black, red and white flag. In England consternation reigns at this, but they are facts which England will have to face as best she may and the conditions which we are creating she will have to tolerate and adapt herself to, unless the execution of the London ultimatum should really attain its end, the industrial annihilation of Germany. In that case, however, not we, but the whole world will have lost the war." The "Syren and Shipping" merely offers to this the comment that the "consternation" which reigns in Britain will not interfere with British commerce and shipping. The Germans may build what they choose; we shall build what we need.

* * * *

AS AMONG men, so among ships, there are some that never seem to fit into the occupations in which they find themselves engaged. A curious case is reported in the shipping press of the steamer "Macedonia." This vessel has just been sold to French owners by the Holland General Atlantic Steam Navigation, a Rotterdam company. Her history is a peculiar one. Shortly after being built, she was sold to Greek owners to act as an emigrant ship, but the first Balkan war coming along soon after, she was sunk by gun fire, and her career as an emigrant ship cut short. She was raised in 1917, and taken to Rotterdam, where she was repaired and altered to make her into a pure cargo carrier. After this was done she was bought by a Dutch company for 3,000,000 florins. Instead of going into service, however, she remained laid up in Rotterdam for about two years until after the Armistice. At this time she was pressed into service to convoy French refugees from Rotterdam to Havre, and this necessitated her again being converted into a passenger ship. After finishing this little job, she was converted back into a cargo carrier, and this was hardly completed, when she was again converted, this time into a floating exhibition ship. These various conversions were represented by a mortgage of more than a million florins, but in spite of all these vicissitudes she is again to undergo a further conversion to make her suitable to her new owners.

* * * *

THE QUESTION of the eight-hour day at sea was brought up in the British House of Commons recently when Dr. McNamara asked the House to approve the action of the Government respecting the Draft Conventions and Recommendations adopted by the International Labor Conference held at Genoa last year. It will be remembered that one of these resolutions or recommendations had to do with the adoption of an eight-hour day for those employed on ships at sea, and that the British delegates accepted this as a standard to be aimed at, but were not able to agree to its immediate application. Before any such recommendation could become of any effect, it would, of course, have to be put in the form of legislation, which would take the form of an amendment to the Merchant Shipping Act. We fail to see how any such thing as an eight-hour day at sea could ever become a practical possibility, and furthermore what good would it do anyone that came under its effects, except in the way of increasing their pay by means of overtime? In ships of ordinary ocean-going type there is, for a large part

of the crew, what practically amounts to an eight-hour day, that is two watches of four hours, with intervals of eight hours between them. In the case of the firemen, where there is no ash ejector installed, it is necessary for the firemen to work a certain period of their watch below in handling the ashes, while the engineers, who are also supposed to work on the four on and eight off principle, usually find a job that requires doing in the time supposed to be off. Sailors usually work on a four on and four off basis, except a certain percentage known as idlers, who are on day work. They work usually about nine hours a day, which is no hardship. A man aboard a ship with too much leisure time on his hands is in a bad way and usually doesn't know what to do with the idle hours. He is liable to develop into a sea lawyer. From our own knowledge, derived from a number of years spent at sea, we cannot see where anybody is going to be benefited by such an arrangement, whereas on the other hand we can see where a lot of harm could be done to the shipping industry.

LLOYD'S Annual Report for the year 1920-1921 has now been issued, and as usual contains a number of very interesting facts. Attention is called to the number of vessels fitted to burn oil fuel, the tonnage represented having increased from 1,310,209 in July, 1914, to 12,796,635 in July, 1921. The consumption of coal that would be necessary for these vessels if they were still coal burning, would represent 20,000,000, tons per annum or 8.7 per cent of the quantity of coal brought to the surface in the United Kingdom in 1920. The report also gives some chronological facts bearing on the use of oil fuel. Thus the first vessel fitted with an apparatus for burning heavy oil derived from shale was the "Himalaya" and an experimental voyage was made from London to Granton and back, the oil being carried in barrels on deck. The next instance recorded was that of the "Ani", and also of the "Sevan" which in 1886 were fitted to burn oil, the fuel being carried in the bunkers. Again in 1887 the "Charles Howard" was fitted with oil carried in bunkers, the result in this case also being a failure. It was not until 1892 that a vessel was successfully adapted to burning oil fuel regularly at sea, and in this year the "Bakuin" was so fitted, and continued in regular service with oil fuel. Dealing with the adoption of internal combustion engines the following interesting figures are given. In July 1914 the number of vessels classed as motor vessels was 297 of 234,287 gross tons while in July 1921 the number had increased to 1473, with a gross tonnage of 1,348,800. Of these vessels over 287 are of 100 gross tons and over, while of those of less than 1,000 gross tons, more than half depend entirely on their motors for motive power. It is noteworthy that with the exception of three steamers all those built in the United States during the year covered were fitted for oil fuel burning.

COMMENCING December 3rd the Furness Withy Company have inaugurated a service from London, Leith and Swansea to Northern Pacific United States and Canadian ports. The first sailing is that of the "Mongolian Prince," and her cargo will consist of tinplate, the first instalment of 150,000 boxes comprising 25,000 tons. This order has been secured in competition with American firms by the Welsh tin plate makers. The return cargo will doubtless consist of the tinned goods which the tinplate furnishes containers for. The next sailing is advertised from London on December 23rd by the "Eastern Prince."

The trend of ship prices may be gathered from an auction sale held recently at the Baltic Mercantile Exchange in London by Messrs. C. W. Kellock and Company, at which three steamers, the "Madame Beatley," "Madame Lunid" and "Madame Midas" were sold. The "Madame Beatley," a steamer of 1131 tons built at Port Glasgow in 1907, with a deadweight capacity of 1720 tons, was sold to British buyers for £10,275 or about £6 per ton. The "Madame Lundi," with a deadweight of 330 tons, built in 1917, was sold to British buyers for £4,600 or about £14 per ton, while the "Madame Midas" built at Port Glasgow in 1904, carrying a deadweight of 3624 tons, was sold to Greek buyers for £11,350, or a little over £3 per ton.

POST WAR developments in the French merchant marine fleet have been against the retention of the fleet as a Government owned entity. The fleet has been sold, but under an arrangement which is beneficial to the Government and the purchasers. The French mercantile marine are the purchasers, by which is meant the whole of the companies carrying on shipowning, and these are represented by a committee. The terms of purchase allow of a long period over which payment can be spread, and in the interval the Government retains ownership. While they still have title to the ships, all maintenance costs, etc., are borne by the purchasers. The value of the ships was fixed by a firm of British experts, and was deemed satisfactory to both parties. There is an arrangement by which if the price of ships rises at the end of five years, the Government will get the benefit of the difference between the present selling price and the later one.

Fire Alarm Operated by Smoke

A new type of fire alarm has been invented in England. This device depends upon its action on the presence of smoke and is not affected by temperature changes which usually are the chief factors in the operation of most first alarms. The smoke detector, as it is termed, consists of a metal cylinder about 8 in. long and 2 in. in diameter, open at each end, so that air can circulate freely through it, and containing two rectangular metallic capsules, one of which is considerably larger than the other. The detector, only one of which is required for each apartment to be protected, is fixed in a high central position, to which the smoke on the capsules is to cause one to bend more than the other. The differential movement is employed to complete an electrical circuit through a relay, and, by means of the latter, a large electric bell or other alarm signal may be operated. The apparatus, says Scientific American, can be used either independently or in conjunction with detectors depending on temperature effects, but it is said to have the advantage over the latter, that its action is more rapid and reliable. In many fires dense smoke would be produced before any material rise in temperature occurred, and, moreover, the smoke would rapidly fill the whole apartment while the temperature rise would remain purely local for some little time.

Cement of Unusual Properties

Among other things which were put to special uses during the war was a cement of unusual properties which was applied by the French. Its high technical value in certain limited fields is worthy of attention. It is described by E. C. Eckel in Engineering News Record as being a lime aluminate, differing from normal portland cement in having an almost total absence of silica. It is prepared by actual fusion, not by mere clinkering; is almost white in color; and will harden with such rapidity as to make a good heavy-gun platform within 24 hours. So far as cost of manufacturing is concerned, the fused cement can obviously be made at least as cheaply as a normal portland. Its uses will be determined then, not by cost, but by its special characteristics, which give it value in certain fields of work, but limit its use in other lines. Considering the composition of the fused cement, its most remarable property, perhaps, is its resistance to the decomposing effects of sea-water and similar solutions, for until this Lafarge cement was introduced there was a tendency to ascribe the breaking up of portland cement in sea-water to its content of alumina, and to search for cements low in alumina.

Recent reports indicate that true mastodons made their appearance in North America at a much earlier period than the public has heretofore been led to believe. One found in Nevada is said to date back their existence to the Middle Miocene. Prior to this the earliest finding went back only to the Middle Pliocene.

The Selection of Steels For Automobiles

Successful Automobile Construction Calls For Proper Selection of Materials—Steel Used Depends Largely Upon Design Adopted —Ductility As Well As Elastic Limit Must Be Considered

*By W. E. JOMINY

ONE of the fundamentals of successful automobile construction lies in the proper selection of materials. However good the design may be otherwise, failure often results through the improper selection of materials by the designer. The selection of steels for automobiles therefore, will be considered. Questions of fabrication and design will be considered only as they affect this. The subject has been divided into two main parts. The first is a consideration of the various factors governing the proper selection of a steel for a given part. The second part is a discussion of the steels most commonly used in present day practice, giving the relative merits of each.

The kind of steel used in any automobile part depends largely upon its design. Lightness, distribution of metal, rigidity, ample radii at corners, tendency toward warping, all of which are embraced in the design of a part, largely control the steel which shall be chosen for the part. For example, most manufacturers use a high grade alloy steel for the rear axle shafts, yet there is a prominent maker of a medium grade automobile who uses ordinary open-hearth plain carbon steel for this part. Again there is a well known low-priced car, which has heat treated alloy steel connecting rods, while most manufacturers use heat treated plain carbon steel and one high grade manufacturer uses annealed plain carbon steel for his connecting rods. Obviously there is a great difference in the physical properties developed in these steels, but in any of the cases just mentioned, it is unlikely that the wrong material has been chosen. The differences in materials are largely the result of the different designs. There are a great many other considerations besides design in selecting the proper steel for a given part, but it is necessary first to know approximately what physical properties are required before any intelligent selection can be made. There are relatively few automobile parts in which the stresses can be figured accurately, but in many cases an approximate figure can be obtained. The required ductility for any part cannot be figured in any way, and for this reason there is much conjecture about this property, which is equally as important as the elastic limit of the steel.

Importance of Ductility

Many engineers pay little attention to the ductility required in any given part, and investigate only the elastic limit required. It should be emphasized that the ductility of a steel is equally as important a property as its elastic limit and that failures occur just as quickly, in fact usually more quickly, when the ductility is too low than when the elastic limit is too low. The minimum ductility required for any part must be determined by the cut and try method, since there is no way of calculating it. Fortunately for parts of like function the minimum ductility required is about the same, so that once determined it can be applied generally. For example, the leaves in a chassis spring should have an elongation of about 9 per cent. or better and a reduction of area of about 28 per cent. or more to function satisfactorily; and whether the spring is lightly stressed or heavily stressed, or whether it is used on a light touring car or heavy truck, the same minimum elongation is required.

Selection of Steel

To choose the proper steel for a given part then, we will first decide what minimum elongation and reduction of area it will be necessary to maintain, and then select those steels which, when heat treated to give an elongation over the minimum required, will give the desired elastic limit. Usually there will be half a dozen or more steels which will answer our purpose. If the part is subjected to large alternating stresses it may be expedient to further limit the possible number of steels for a given part by choosing those having high Stanton values and high impact values. Even limited in this way there will probably be several steels usable for any part from which must be chosen the most economical one to use.

In many cases properties other than structural are required, such as resistance to wear, resistance to burning, high tensile properties when hot, magnetic permeability, resistance to corrosion, etc. The same method of choosing steels for these parts can be used as mentioned above; the additional properties required simply limit the number of steels from which we must choose the most economical.

The most economical steel is not necessarily the one with the lowest first cost although this is a consideration along with the ease with which the steel can be forged, burned, annealed, heat treated, warped, straightened and machined. Ability of the mill to consistently produce the steel free from pipes, seams and the many inherent defects, as well as possible sources of supply all enter into the problem. These qualities are not easily ascertained and require careful study of their use on a production scale. Experiments carried out on a production scale introduce so many variables that it is difficult to arrive at accurate results. The large difference in shop methods, as well as the differences in the number of cars produced per day, are perhaps the main reason why all shops are not unanimous in the choice of one type of steel.

Chrome-nickel, straight nickel, chrome-vanadium and recently chrome-molybdenum steels each have their staunch supporters, and undoubtedly each excels the others under certain conditions. For any given shop there is generally

TABLE NO. 1.

	(a) Per cent	(b) Per cent	(c) Per cent	(d) Per cent	(e) Per cent	f) Per cent

*Author is metallurgist at the Studebaker Corporation, Detroit, and presented this material by title before the Indianapolis Convention of the American Society for Steel Treating.

one steel which proves most economical, and the tendency is to use this wherever possible. This tendency should not be criticized, because it is desirable to use as few steels as possible in a plant. A reduction in the number of steels used means a reduction in the heavy investment an automobile manufacturer has in his stock of steel. It also makes for better purchasing conditions, better production conditions and less chance for mixing steels. Summing up the manufacturer's metallurgical problem, we find that he wishes as few different steels as possible which will meet his shop conditions economically and possess physical properties to satisfy the requirements of his many parts.

Having these requirements in mind, the following list of steels has been drafted and is intended to cover the needs of a manufacturer who is making all his parts at his own plant. Only the relatively important parts are mentioned, but these steels should take care of all parts.

The Steel Used

(1)—A steel for sheets and strips of average importance. This is usually an open-hearth 0.10 per cent. carbon steel, the same as S. A. E. No. 1010. It is used for fenders, body plates, splashers, hoods and various stampings. It is finished in most any degree of smoothness desired and annealed in various ways to produce ordinary or extra drawing qualities.

(2)—A good machining steel for ordinary bolts, nuts, screws, studs and many other parts which are lightly stressed. A cold rolled or drawn bessemer steel of carbon content about 0.08 to 0.16 per cent, corresponding to S. A. E. No. 1112, is generally used. More attention is paid to the machinability of this steel than its strength. It is not considered a good carburizing steel, although it is used for this purpose by some makers of low-priced cars. Because of its easy machining qualities it is popular with men in charge of production work.

(3)—A plain carbon carburizing steel for such parts as camshafts, tappets, spring bolts, water pump shafts, front end gears, etc. Following is the common steel used for these parts:

	Per cent.
Carbon	0.15—0.25
Manganese	0.30—0.60
Sulphur	0.050 maximum
Phosphorus	0.045 maximum

This steel is easily forged and machined although its machining qualities are not as good as steel (2) given above. After carburizing it is necessary to water quench this steel to produce a scleroscope hardness of 75 or more. If the steel is properly heat treated the Brinell hardness of the core will not exceed 200. It is not customary to refine the grain of the core of camshafts, tappets or water pump shafts. In the case of tappets and water pump shafts it is not deemed necessary and in case of camshafts too much warpage is induced. Some makers use a steel ranging in carbon from 0.10 to 0.20 per cent for these parts. Better ductility results from the use of this steel but it is more difficult to machine.

(3-a)—Stampings, parts made from seamless tubing and frames are made from the same analysis steel given under (3). Frames also are quite commonly made from a 0.20 to 0.30 per cent. carbon steel, other elements the same as under (3).

(4)—A forging steel of medium carbon for parts not too highly stressed, commonly used for connecting rods, crank-shafts, front axles, spring clips, brake levers, etc. Many manufacturers use alloy steel for these parts and, as previously stated, the design largely determines which steel must be used. The medium carbon steel, however, is the most economical steel for these parts and if the design permits this steel will be used. If the design requires steels of higher physical properties some of the alloy steels which will be discussed later can be used. Following are the steels generally used in this group:

	(a) Per cent.	(b) Per cent.
Carbon	0.30—0.40	0.35—0.45
Manganese	0.50—0.80	0.50—0.80
Sulphur	0.050 max.	0.050 max.
Phosphorous	0.045 max.	0.045 max.

Both of these steels forge easily, respond well to heat treatment and are fairly easy to machine. Unless the sections are very irregular water may be used as the quenching medium. The Brinell hardness to which these parts are usually held depends again on their design but it will be found usually that when made from this steel connecting rods will have a hardness somewhere between 190 and 290, crankshafts between 217 and 290 and front axles between 190 and 260.

(5)—A steel for coiled springs, lock washers, etc. This steel will have the following analysis:

	Per cent.
Carbon	0.58—0.70
Manganese	0.70—1.00
Sulphur	under 0.050
Phosphorus	under 0.045

Where the size is suitable, coiled springs generally are coiled from wire of this analysis which has been tempered at the mill. After coiling, the springs are given a low draw at about 500 degrees Fahr. to remove the coiling strains and used in this condition. Whether tempered at the mill or heat treated at the spring plant, satisfactory coiled springs will have a scleroscope hardness between 55 and 70.

(6)—A steel for keys, coiled springs of thick wire and ball bearing balls. Following is the steel generally used here:

	Per cent.
Carbon	0.90—1.05
Manganese	0.25—0.50
Sulphur	under 0.045
Phosphorus	under 0.0.

This steel is also used in low priced cars for chassis springs.

(7)—An alloy carburizing steel for parts where resistance to high stresses as well as wear is a factor, as case hardened gears, piston pins, steering knuckle pins, differential crosses, ring gears, ball bearing races, etc. Here we find a diversity of opinion as to the steel required. The steels shown in Table No. 1 are most common.

Steel (a) is easy to heat treat and gives highly satisfactory results, producing a very ductile core. Unless carefully prepared, however, it is rather difficult to machine.

Steel (b) machines a little easier than (a), but does not give quite as ductile a core.

Steel (c) is a good carburizing steel, but due to the increasing cost of vanadium, the steel has a rather high first cost.

Steel (d) is easier to machine than (a) but does not give quite as ductile a core and requires a little more care in heat treatment.

Steel (e) requires careful heat treatment to produce a soft core and a hard case, and several concerns have not been able to use it successfully on a production scale. When properly heat treated however, this steel has good physical properties, and has been the salvation of some otherwise impossible designs.

Steel (f) gives excellent physical properties and is much easier to heat than steel (e). Where heat treating difficulties are encountered, steel (f) is often substituted to advantage for (e). Steel (f), however, is more expensive than (e).

All of these steels can be hardened to a scleroscope hardness of 75 minimum, using oil as a quenching medium, in fact, many manufacturers require a minimum of 80. Water can be used as a quenching medium for steels (a), (b), (c) and (d) for some sections, but because minimum warping is desired oil is generally used. Nearly all parts made from those steels are double quenched. An exception to this is the ring gear which is seldom double quenched because the high heat to refine the core produces too much warping.

(8)—A steel for the usually high stressed parts such as rear axle shafts, steering knuckles, propeller tubes, steering arms, connecting rod bolts, highly stressed studs, etc. Where design makes it necessary, front axles, spring clips and connecting rods are also made from this steel. Table 2 shows a wide range of steels used:

Where different carbon ranges are given it should be remembered that the lower the carbon content the easier the steel is to forge, anneal, machine and heat treat but also the lower the carbon the lower the physical properties of the steel.

Steel (a) is a popular steel. It forges rather easily, is not difficult to anneal, responds well to ordinary heat treatment, although in general requires oil quenching, and gives good physical properties.

Steel (b) forges easily, is easy to anneal, is easily heat treated and far less

sensitive of over heating than (a), (c) or (d). It can be quenched in water and gives good physical properties. Due to the high cost of vanadium, the first cost is rather high and because of higher heats required to treat it, is a little harder on the furnaces.

Steel (c) is rather easily forged, is not difficult to anneal or heat treat, but the hardness does not penetrate well in large sections. In small sections it gives satisfactory physical properties. This steel also seems to have more inherent defects than the others.

Steel (d) is rather difficult to forge, difficult to anneal, requires careful heat treatment but gives excellent physical properties. Usually when steel (d) is used in a manufacturer's plant it is because of some one particular part and he makes all his other parts in this group out of steel (a), (b) or (c).

Chrome-molybdenum steel has been introduced recently as an automobile steel with what seems to be a promising future. At the present time, however, it has not been sufficiently used in quantity production to include it in our list.

(9)—A steel for gears. This function requires all that we can get from a steel. We must have resistance to wear, to shock, and to very high stresses. There are still quite a number of cars made with carburized gears and in this case one of the steel under (No. 7) is used. The general consensus of opinion seems to be, however, that all things considered, the oil hardened gear is more satisfactory. The following are the more common steels:

TABLE 3

	(a) Per cent	(b) Per cent	(c) Per cent
Carbon	0.45—0.55	0.40—0.50	0.45—0.55
Carbon	0.40—0.50	.....	0.40—0.50
Manganese	0.30—0.60	0.50—0.80	0.50—0.80
Sulphur	0.040 max	0.045 max	0.040 max
Phosphorus	0.040 max	0.040 max	0.040 max
Chromium	0.60—0.90	.....	0.45—0.75
Nickel	1.50—2.00	3.25—3.75	1.00—1.50

Steel (a) is difficult to forge, difficult to anneal, hard to machine, must be heat treated with great care but gives excellent results. The steel with the lower carbon range eases these difficulties.

Steel (b) is a little easier to forge and anneal than steel (a) but in large sections the hardness does not penetrate as well as in the other steels. It does not have physical properties as good as (a).

Steel (c) is somewhat easier to forge, anneal and machine than (b) and has about the same physical properties.

Gears made from these steels and heat treated to a scleroscope hardness of 70 to 75 seem to give the best results.

(10)—A steel for chassis springs. We have already discussed the plain carbon steel that is used for lightly stressed springs. There are three other steels which are commonly used which have the following analysis:

TABLE 4

	(a) Per cent	(b) Per cent	(c) Per cent
Carbon	0.45—0.55	0.40—0.50	0.65—0.75
Manganese	0.60—0.80	0.80—1.00	0.85—1.05
Sulphur	0.045 max	0.040 max	0.035 max
Phosphorus	0.045 max	0.040 max	0.035 max
Silicon	1.80—2.10	.....	0.30 max
Chromium	.....	1.05—1.20	0.30—0.45
Vanadium	.....	0.15 min.	.....

These steels all give good results. Steel (c) is generally conceded to be the best of these three, but it is more delicate and consequently more difficult to handle than the other two. The hardness of the spring leaves should be as close to 400 Brinnell as is commercially possible to maintain.

(11)—A magnet steel. The following analysis is common for this purpose:

	Per cent.
Carbon	0.80—0.90
Manganese	0.30—0.50
Silicon	0.25—0.40
Chromium	1.90—2.10
Tungsten	0.75—1.00

(12)—A valve steel. Strength, resistance to wear and resistance to scaling at elevated temperatures characterizes a good valve steel. Most of the lower priced cars have valves made from a cast iron head cast or welded onto a machine steel stem. These valves resist scaling at high heats, quite satisfactorily but warp and pit easily. If better materials are required one of the steels shown in Table 5 should prove satisfactory.

The principal merit of steel (a) is in its relative cheapness. It is easier to forge and machine than the other steels in this group and has the lowest first cost. It does not resist scaling well but will not warp as easily as the cast iron head valve.

Steel (b) costs a little more than steel (a) but is a little stronger at high temperatures and so resists warping better.

Steel (c) is the strongest steel of the group at high temperatures, 1,200 to 1,700 degrees Fahr. and for this reason has the highest resistance to warping.

Steel (d) is not as strong at high heats as (c) but resists scaling much better. For this reason (d) under most conditions is better than (c).

Steel (e) resists scaling a little better than (d) but is otherwise about the same.

Steel (f) resists scaling as well as (d) and is nearly as strong as (c) at high temperatures. It is about the best valve steel we have today which has been used on a production scale.

These twelve steels cover every need of the automobile engineer in designing a motor car. It has been necessary to be extremely brief in discussing each of these steels in order to cover them all. If a manufacturer makes every part of his automobile at his own plant, he will require a minimum of twelve steels, and if he uses cast iron head valves, he can cut down to 11. Under present conditions, this is the minimum number of steels from which an automobile can be built on a production scale. No manufacturer makes all parts for his automobile at his own plant, yet it is not at all uncommon to find 20 or more different steels in his stock. While it may not be possible for him to get down to a minimum of twelve steels, he should be able to get along with much less than 20. In these times of retrenchment and economy, it might be well for the manufacturer to consider the opportunity of large saving by reducing the number of steels in his stock.

Aeroplanes are now maintained by the province of Quebec for the protection of forests from fire.

MARKET DEVELOPMENTS

Several Reductions in Price are Announced

Wire Products Prices Have Dropped—This Follows Tubular Goods—Price Cutting the Cause of Downward Trend—Sheets and Tin Plate Remain Firm—Local Steel Market Good—Other Markets Very Quiet

THERE is a very conflicting story to tell this week, as some markets show entirely different conditions. For example:— Pittsburgh reports several reductions in the price of wire products, this being the result of frequent, if not general price cutting by independent wire mills. Whether the new prices will be low enough remains to be seen. If cutting continues, the steel corporation, who announced the new prices, will, no doubt, lower them still further, until no further price cutting can take place.

Bars, shapes and plates are quotable at 1.50c to 1.60c, but 1.50 is the most common. Sheets stay firm, the price being 3.00c for black and 4.00c for galvanized. Tin plate remains at 4.75c, although some independents are shading this price 10 and 15 cents on particularly desirable orders. Whether steel prices are thoroughly liquidated remains an open question.

The steel market in Toronto has surprised even dealers themselves. Instead of December being a very poor month, it has developed into a better month than November. No one seems able to explain why this has occurred, but the orders on the books tell the story. The business secured is general, and not on any one line.

Montreal reports a very quiet market in all lines. Toronto, with the exception of the steel market, is also very quiet, and no improvement of note is looked for this year, in fact not for some time yet. Tin prices in Montreal have tapered off slightly, but nothing to speak of. Until a steady demand occurs, such small changes will not mean much.

No one cares to predict what 1922 will usher in, but the consensus of opinion seems to be that nothing of importance will occur on the steel market until March or April.

NEW PRICES ANNOUNCED ON WIRE PRODUCTS—PRICE CUTTING THE CAUSE

PITTSBURGH, December 28th.—As a result of frequent if not general price cutting by independent wire mills, the American Steel and Wire Company (Steel Corporation) last Wednesday, December 21, began quoting new prices on wire products, as follows: Plain wire, 2.25c.; galvanized wire, 2.75c.; wire nails, $2.50; cement coated nails, $2.15; painted barb wire, 2,65; galvanized barb wire, 3.15c.; polished staples, 2.65c. Independents are of course forced to meet these prices, while it is a question whether they will cut them. They will probably find them low enough, but if cutting continues the Steel Corporation will no doubt continue reducing its prices, according to its general policy in all lines, until it discovers a level that will not be cut.

No precise statement can be made as to how much reduction these new prices represent, because there was no clearly defined market level. They are no lower than some prices that have lately been made in active competition, while they are $7 a ton on plain wire and $8 a ton on other products below the prices that were nominally regarded as the market in October. There was an "advance" September 12, $2 on plain wire and $3 on nails and barb wire, and the advance seemed to hold for a time, while later prices slipped off. The new prices are exactly $5 a ton below the prices ruling before the September 12 advance, and since the early part of July.

In the previous week the Steel Corporation had reduced tubular goods in somewhat similar manner. These two lines, wire products and tubular goods, are the only ones that have shown any price change of consequence for several weeks. Bars, shapes and plates remain quotable at 1.50c. to 1.60c., with the difference that 1.50c. is now rather common even on moderate sized orders, while a couple of months ago the price was made only on very desirable orders. Probably 1.60c. is sometimes obtained, but hardly on business of any importance. There is some doubt as to whether 1.50c. would be shaded even on a very desirable order. Perhaps 1.50c. may be considered the bottom of the market, but it is improbable that this will be the case indefinitely. That is, the price is quite likely to be lower before it is higher. The market is now so steady that buyers have no incentive to wait for lower prices, as if they need material they would lose more by deferring operations than they would make up by a concession in prices. Should an active buying market develop competition would probably force prices down a trifle. As the market now stands there is little incentive to cut prices farther.

Sheets are phenomenally firm at 3.00c. for black and 4.00c. for galvanized. Buyers have been quite unable to budge any of the mills from these figures and the market is in a striking contrast to the market that obtained some time ago, when there was no regular price at all. These prices are $5 a ton higher than those ruling late in August and early in September, when a good bit of business for delivery to the end of the year was booked, while the cost of production is a trifle lower than in the latter part of August. It is claimed, however, that mills were losing money then.

Tin plate is quite steady at the regular price of $4.75, but it seems some independents are occasionally shading the price 10 or 15 cents a box, to secure particularly desirable orders.

There is room for an almost unlimited amount of discussion on the subject of whether or not steel prices are thoroughly "liquidated" as well as on the subject of whether or not prices are below the cost of production. Merely to make one comparison, the Bureau of Labor index number of commodities at wholesale, taking 1913 average prices as 100, stands at 149 for November, having fluctuated only between 152 and 148 since last May, although the individual groups of commodities making up the

general average have had fluctuations of considerable magnitude. On the same basis of computation, finished steel products would now stand at 126, and thus they appear to be much more thoroughly liquidated than commodities in general. Farm products, however, stood in November at 114, or still lower, while building materials stood at 197 and housefurnishing goods at 218.

On this basis steel products ought to advance, or several groups of commodities should come down. There is room for attacking this argument, however, on the basis that 1913 steel prices were fairly profitable, and were 21 per cent. higher than at the end of 1914, when there had been quite a decline. Steel prices now, while 26 per cent. above the 1913 average are 52 per cent. above the 1914 low point. Then, as to costs, there is room for much argument, because the cost of production varies according to the rate of operation. A mill running at 30 or 40 per cent. might lose money at present prices and might have very comfortable profits if running at 90 per cent.

Prospects are, as indicated in last report, that steel ingot production in the first eight months of next year will not pass below a rate of 20,000,000 gross tons a year or above a rate of 35,000,000 gross tons. This means one thing to the producer and another thing to the consumer, because steel capacity has so greatly increased, being one-half greater than in 1914 and double the capacity in 1910. A 20,000,000 ton rate would represent, on a conservative basis, a rather fair rate of steel consumption. It would mean a great deal of machinery, agricultural implement and automobile building, not a little consumption in dwelling house construction and would also cover a moderate amount of upkeep of the railroads, though no expansion.

On the other hand, even a 35,000,000 ton rate would be low for producers, according to precedents, for it would only be about two-thirds of capacity, and in the past steel prices have never advanced unless mills were running at about 85 per cent. The average rate in the past three months has been about 23,000,000 tons, but there is likely to be a dip for a time, owing to some mills closing for a week or two.

Pig iron continues very dull, with the market quotable at $20 for Bessemer, $19 for basic and $19.50 for foundry, f. o. b. valley furnaces, freight to Pittsburg being $1.96. Old contracts, some of them quite old, have now been pretty thoroughly worked out, while consumers have reduced their stocks to almost nothing. In January there will probably be a buying movement, in a conservative manner, and the consumption may force prices down a trifle, but prices cannot go down much with present freight rates on ore, coke and limestone, while there is no reduction probable even for many months that would permit such a decline.

Connellsville coke for spot shipment continues weak, with quotations at about $2.90 to $3.00 for furnace and $3.75 to $4.50 for foundry. Two contracts for furnace coke for first quarter have been made, at $3.25 and $3.40 respectively. Some coke could be had at less than $3.25 for the quarter, but not the best grade.

POINTS IN WEEK'S MARKETING NOTES

Several new prices on wire products have been announced. This move is the result of frequent if not general price cutting by independent wire mills. The American Steel & Wire Co. have issued these latest prices, and it is believed they will be low enough to prevent further cutting. If not it is likely they will drop until a level which cannot be cut is reached.

Sheets stay firm, being priced at 3.00c. for black, and 4.00c. for galvanized. Present prices are $5 a ton higher than those existent late in September. Tin plate is also steady at $4.75, although some independents are said to be shading the price 10 or 15 cents to secure desirable orders.

Prospects are that steel ingot production for the first eight months of 1922 will not be lower than 20,000,000 gross tons a year, nor higher than 35,000,000. A 20,000,000 ton rate would represent a fairly good figure, and would mean considerable machinery, agricultural implement and automobile building, and would also cover a moderate amount of upkeep for railroads but not for expansion. On the other hand a 35,000,000 ton rate would be low for the producers. Details of this are given in the Pittsburgh letter.

Montreal says that the present steel quotations are, in some cases, below actual cost of production. Pig iron is very quiet. It is well known that if any good volume of business develops the price will have to go up, unless operating costs are reduced in the meantime. Few manufacturers care to risk an opinion on the events for the coming year.

Toronto steel market is the only bright spot in the local market. Business in December is greater than in November in spite of the fact that December is usually a very dull month. The other markets, however, are very quiet.

STEEL MARKET ONLY BRIGHT FEATURE

TORONTO, December 28th.—"People have been buying too many rocking horses, electric trains and so on, to think of the machine tool market." Thus, in a few words, one dealer sums up the situation. The Christmas season just passed has been good for the retailer handling suitable lines for gift purposes, but so far as machine tools, steel, or scrap iron are concerned, there has been very little moving. This might be as good a time as any to suggest that in future, various dealers make it a point to find out what the different manufacturers require, then coax them into giving each other machine tools, or perhaps a ton or so of scrap as a Christmas present. However as the idea is the main thing, this supplies the idea, and it is now up to dealers to work out the details.

Seriously, the market generally is very quiet. Not that there is absolutely no business moving, for such a statement would be incorrect. Strange to relate the only activity of note, is from a most unexpected quarter, the steel market. Instead of December being a poor month, as it generally is, we find that the sales this month exceed those of November. Dealers themselves cannot explain the unlooked business. The fact remains it is there on their books, and they are satisfied to let it go at that. Nothing really featured, the demand being general in all lines.

We would like to report a similar story of the machine tool market, but in this case, there is nothing moving. Manufacturers are sitting tight, refusing to spend any money until they are satisfied the turn in the trade has arrived. A similar state of affairs exists on the small tool market. The metal market is quiet, although prices remain fairly firm. No improvement is looked for this year, so that next week's letter is bound to be very much a repetition of the present one. In fact it will be March or April before anything startling will happen on the steel market.

The use of acetylene as a motor fuel is being developed in Switzerland. It has not proved to be as satisfactory as gasoline, it is said. The finding of Keel, a Swiss authority on acetylene and its use, is that 1 kg of acetylene gave as much energy as 2 kg. or 2.5 kg. of benzol, though the heats of combustion are only as 6.5. Explanations given are that there is an excess of air in the benzol fuel mixture while acetylene can be burned with its theoretical air allowance. In tests the combustion of acetylene proved to be complete while that of benzol was shown to be incomplete. Reporting on the variation of the acetylene percentage in the air mixture, Keel stated that on account of high pressures and temperatures produced in the cylinder, the advisable limits extended from 1.5 per cent. to 7.5 per cent. of acetylene. Haber, another authority, sets these limits as 3% and 5%.

THE VARIOUS MARKETS ARE RESTING APRIL FIRST QUOTED AS TURNING POINT

MONTREAL.—With the closing days of the year, purchasing in the lines of iron and steel has dropped to practically the zero point. Throughout all lines no price changes have been reported except from isolated points where more or less special conditions exist.

Looking backward, the year has not been one of good business. Yet after all "good" and "bad" are terms of abstract rather than concrete meaning, and really are relative in value. At first glance it is only natural to compare the volume of business of 1921 with the years that immediately preceded it. Thus, these snap conclusions are only productive of more or less alarming conclusions. We must go deeper into the problem. Then we find that war conditions produced in four years growth and expansion in our metal working industries, that under normal conditions would have taken from ten to fifteen years to attain. The head of one prominent machine tool industry in Canada is credited with the statement that ten times more machine tools were built per year, during 1916, 1917 and 1918 than were built in any one year previous to that time. This is really more or less true of most other industries. These statements largely explain why there is no demand for machine tools, and why there is so much idle equipment throughout the country. The practical elimination of the shipbuilding industry in Canada threw a large quantity of machine tools, raw material, supplies, and labor on the market. The shell industry has been largely absorbed in all its phases by the general manufacturing industries engaged in producing goods whose uses are of a more peace-like nature. Export trade has fallen off to a very low level, owing to general re-adjustment conditions existing in practically all overseas lands.

Yet, withal, the consumption of steel and the products of the iron and steel industries, is not far behind the figures shown in the records of pre-war years. Thus in making our comparisons it is far more comforting to go back to these years to get our standard that we choose to call by that very elusive expression "normal conditions."

Throughout the whole Dominion our industries are built up very largely on a sound basis. Although many do not appreciate the statement, and are bewailing the fact that bad times have fallen upon us, it is still true that conditions in Canada are better than those existing in any of the belligerent countries, with the possible exception of Germany, which country has had several advantages, chief of which is that of her deflated currency. Yet when one analyses all conditions that exist in that country, her lot is not rosy and few of us would care to change places with her.

Our steel mills have a reasonable amount of business on their books which should carry them through to February or longer, and then it is always reasonable to expect that the railways and industrial concerns will have come into the market by that time for their 1922 requirements. Up to the present the various mills are running along at about that point which enables them to break even. Structural steel demands are low, as are the demands for merchant bars. Plates, and sheets in particular, have been enjoying a satisfactory business. Machine tool sales are very scattered while small tools and supplies are in fair demand.

Present Quotations

The present steel quotations are below actual cost of production in many cases, and are down below the average prices that prevailed over the period between 1904 and 1914. This, in spite of the increased cost of production. Pig iron is very quiet. Some steel mills in the U. S., that produce pig iron as a side line, have been cutting prices down to production costs, or lower, in the past few months in order to produce enough business to keep their organizations together. This, of course, forced down the price locally. It is well known that if any volume of business develops the price will have to go up, unless operating costs are meanwhile reduced. Last week it was decided that present prices would prevail until after the New Year.

Few manufacturers care to risk an opinion on the trend of events for the coming year. The general consensus of opinion is that no special impetus to business will be felt on January 3rd. The "dead-wood" has been worked out of most organizations and conditions are on a "solid-rock" foundation. "The corner has been turned" and conditions will gradually improve if honest efforts are put into the work of all. It will be a long strong pull and to attain success everyone must pull together. Many matters will be considered here and in the States during the coming winter months, the settlement of which will have its influence on business in all lines. Perhaps the most important of these matters is the readjustment of freight rates in the U. S. A. This matter will be considered in March. It is felt that a general all-around reduction in freight rates will do much to encourage business. Such an improvement will have its influence on Canadian conditions very soon after the improvement to the South. Some authorities in the world of finance go as far as to state that April 1st will be the date when we can look forward to much better things.

The non-ferrous metals continue inactive at this season. Tin, which was quoted at 39 cents last week, has weakened slightly, and now 38½ cents is asked. Other than this slight change no quotations have been altered.

The future lies largely with ourselves. Opportunities will not likely occur, rather will they have to be created. The future is bright for all those who wish to consider it bright and are ready to go forward and work, to prove to themselves and the world the correctness of their beliefs. Old fundamental conditions still prevail, and the degree of our success individually and collectively will be in the same measure as we apply the old and proven methods.

MANY IMPORTANT FACTORS MUST BE CONSIDERED

(Cont. From Page 163)

unchanged through the war and the period that intervened. Where in the United States commercial loans were up to 6, 7, 8, 9, and 10 per cent. the Canadian banks continued to provide accommodation for their Canadian clients at the old rate. In the United States the rate fluctuated; a borrower might be called on to increase his rate at any time; he did not know what his money would cost for a year's advance or even six months; in Canada the uniform rate held and in this the banks stood almost alone.

The principle of Canadian banking, under the extensive branch bank system, is to maintain an even commercial rate to stabilize industry and commerce. Changes in the business situation are not indicated by shifting bank funds according to supply and demand as reflected by what borrowers are willing to pay but by changing classes of investments. This fact was perhaps responsible for the fact that there was not as violent a post-war adjustment in Canadian business as was the case in the United States. Commercial credit during the period of inflation was on a much higher rate in the United States than in Canada which was an additional factor in raising production and marketing costs.

Messrs. Jones & Glassco of Montreal, have recently completed a contract for the entire conveying system of the National Breweries, Ltd., of Montreal. Owing to local conditions, and certain special requirements , a departure from standard equipment and attachments was necessitated, which makes the installation very interesting. Exhaustive and thorough tests of the equipment have been made, and the whole installation has been accepted as satisfactory. The equipment is capable of handling more than the capacity of the plant, this being slightly in excess of twelve thousand dozen bottles per day. The contract amounted to somewhere about $50,000.

In Westphalia a hand spraying device consisting of a hopper shaped bucket filled with stone dust and carried on the shoulders is used to spray mine roofs and sides otherwise inaccessible. Power is furnished by a trailing connection to a compressed air pipe. The bucket has a long spout to direct the spray. Dust is sucked from the bucket by an injector and delivered with great force.

INDUSTRIAL NEWS

The Montreal Bolt and Forging Co., Montreal, Que., have been incorporated with $1,000,000 capital.

The Moncton Tramway Gas and Electric Co., Moncton, N. B., has awarded a general contract for construction of a power plant to cost $35,000.

The Bell Piano and Organ Co., Guelph, Ont., is considering the installation of two new boilers to replace the three at present in use.

The Universal Wrench Co., Windsor, Ont., has been incorporated with $250,000 capital to negotiate in the machine tool business.

The New Era Machine and Tool Co., Toronto, Ont., has been incorporated with $50,000 capital to manufacture machine tools and machinery.

The Commercial Cable Co., plans an extension to its wharf at Halifax, N. S. A description of the site and plans have been sent to the Department of Public Works at Ottawa.

The MacKenzie Basin Fisheries, Ltd., Calgary, Alta., has been incorporated under the Dominion Companies Act, with a capital of $200,000 to carry on a general fishing and fur business to operate ships for transportation of freight and passengers.

The Dominion Steel Corporation, Sydney, Nova Scotia, has specifications ready for a large machine shop, to be erected in Sydney. The company has in view the centralization of all machine work and repairs for its railroads, collieries and steel plants. It is stated that construction will start in the near future.

A company in which Mr. R. Patterson, 770 3rd Ave., East, Owen Sound, Ont., is interested, proposes to build a four unit cement-making plant there to have the capacity of 4,000 barrels per day. The Canadian Central Electric Company, Peterborough, Ont., has awarded a contract for a new power house.

Guelph, Ontario, is preparing to purchase equipment for the waterworks plant in connection with the decision to supplement the present steam equipment with that of electrically-driven centrifugal pumps. The city will purchase one imperial three million gallon electrically-driven centrifugal pump and one three million gallon electrically driven Booster pump as an auxiliary. Two three million gallon gasoline or Diesel driven units are to be bought.

The Northern Rubber Co., Metcalfe Street, Guelph, Ontario, will erect a warehouse at the cost of $11,000.

The Oshawa Sales and Service, Ltd., has been incorporated with a capital of $100,000 to manufacture trucks, tractors, machinery and implements, etc.

The Ontario Machinery and Supply Co., Hamilton, Ontario, has been incorporated with a capital of $50,000, to manufacture and deal in every kind of machinery.

The contract for an addition to the pumping and distilling for the water works department for the city of Montreal, Que., has been placed with the Dominion Engineering works.

The electrical contract for alterations to office buildings costing $160,000 for the Toronto Hydro Electric and Toronto Transportation Commission is awarded to Canada Electric Co., Toronto.

The Lawrence Park Garage, Ltd., Toronto, Ont., has been incorporated with a capital of $100,000 to carry on the business of a general garage including the purchase and sale of automobiles and accessories.

The general contract for the construction of car-cleaning shops costing $50,000 for the Canadian Pacific Railway, at Glen Yards has been awarded to G. G. Loomis, 200 McGill Street, Montreal.

The Birmingham Motors have leased their building on Monaghan Road., Peterborough, Ontario, with an option to purchase, where it proposes to install machinery, and carry on manufacturing operations. Jamestown, N. Y., interests are behind the new enterprise.

The International Ferry, Ltd., Sarnia, Ont., has been incorporated under the Dominion Companies Act with an authorized capital of $200,000 to operate a ferry service for automobiles, passengers and freight of all kinds between Sarnia, Ont., and Port Huron, Mich., and to carry on a general navigation and steamship business.

The shops of the Canadian National Railways at Moncton, New Brunswick, were closed on December 20th and will remain closed until January 2nd giving the employees a Christmas vacation. During the interval more or less expensive repairs and over-hauling of the shops will be attended to. It has been the custom to close the shop for certain periods each year during the Christmas Season and the closing this year is only following a precedent established for some time past.

The Alberta Foundry and Machine Co., Calgary, Alta., has recently been incorporated with a capital of $1,000,000.

Figures secured from the Department of Commerce, Ottawa, show that Canada's cost of living for twenty-nine staple articles fell from $11.48 to $11.08 during November.

Contracts for heating and sprinklers for a manufacturing building costing $75,000, for the Goldstein Mfg. Co., 180 John Street, Toronto, is awarded to W. J. McGuire, Limited, Toronto.

Far more improvement is shown this year over last year at Brantford, Ontario. During the past year local improvement work carried on by the Board of Works, totalled $208,953, as compared with $80,000 the previous year.

The Buffalo Specialty Co., 601 Northland Ave., Buffalo, N. Y., plan to construct a factory at Bridgeburg, Ont., for the manufacture of liquid veneer. Estimated cost $40,000. The Northern Textiles Limited, Chesley, Ont., plan to remodel their woollen mill.

The Continental Electric Co., 505 King St., East, Toronto, Ont., recently incorporated to manufacture suction cleaners, etc., has commenced operation. It is the intention of the company to extend the operating capacity in the early future, installing additional machinery.

Fredericton, N. B., reports that the Chestnut Canoe Co. has received an offer from Alliston, Ont., to locate its factory in that town, for the re-establishment of the factory which was almost entirely wiped out by fire some days ago will not be definitely decided for some months.

Leslie & Harding, Georgetown, Ont., are in the market for machinery and equipment for making skates. The Woodstock Powdered Milk Company, Woodstock, Ontario, are in the market for special equipment for milk powder manufacture, including evaporators, separators, etc.

Many Canadian manufacturers will exhibit their wares at the British Empire Exhibition to be held in 1923 at Wembly Park, in the North of London, England. This is the event in which the Prince of Wales is taking a personal interest. The President of a well-known company making a steel product stated that he would probably take space not only at this Empire Exhibition but also at the Industries Fair, which will be held in 1923, about six weeks prior to the big Empire event.

Mr. Normandin, 15 3rd Avenue, Shawinigan Falls, Que., is constructing a foundry at the cost of $5,000.

It is probable that a new bridge will be erected in London, Ont., to open Richmond St. through to South London. The cost is placed at around $140,000.

A greatly improved industrial condition is reported from Tillsonburg. Two local firms there are reported to be running with full staffs and full time while others are speeding up.

One new eight roomed school and two four roomed additions to present buildings are planned by the authorities of Fort William, according to the Times Journal. An approximate figure of cost has been placed at $175,000.

The Canadian Government early next spring intends to start the construction of a modern life saving station on the Main Duck Islands in Lake Ontario. The need for the station has long been felt on account of wrecks. The station will be one of the most modern in Canada.

As a result of the completion of the Chippawa canal sufficiently to let water into it, the Hydro Electric Commission will make an effort to salvage about $10,000,000 worth of equipment. The commission will have for sale concrete plants, electric motors, etc. An official opening of the canal took place the week of December 26th.

London, Ont., spent $937,202.14 in 1921 for walks, curbs, gutters, pavements and sewers according to a report made by the City Engineer, Mr. Brazier. Eight miles of asphalt pavement were laid at a cost of $454.931. All work has been suspended for the cold period except the construction of sewers which is proceeding to furnish work for the unemployed.

The Tanning Industry in Canada has passed through a trying year, especially in the opening months, but has improved steadily however and the outlook is regarded as hopeful. At the present time a fair but limited volume of trade is being done by most tanners, and business, it is felt, is gradually getting back to normal and unless further trade depression takes place—which seems unlikely—the industry in 1922 should be one for running fairly full capacity.

The condition of the paper mills business has improved considerably in the last several weeks. Four of the largest mills in Canada have a production record of 100 per cent. or better in November. The slackening in demand that was anticipated did not materialize. Statistics show that the shipments of Canadian mills have exceeded production. In expressing an opinion of the Paper Industry outlook, several executives have indicated that they expect an improvement in the market for their products during the next year. It is expected that there will be keen competition for export business and high priced pulpwood has not yet been entirely worked off.

The Toronto Board of Control has been calling for tenders for sand dryers for an asphalt plant.

Engraving houses in Toronto are reported to be receiving orders for catalogues from firms which have not been advertising for a long period. This is taken as an evidence that business concerns are getting ready for busier and better times.

From Hamilton, Ont. come reports of improved industrial conditions. Several of the key manufacturing concerns of that city are gradually becoming busier and the acuteness of unemployment has been removed. Seven hundred men have been taken on by various plants.

A business boom without precedent will follow the disarmament conference at Washington, according to the views of Mr. Marquis Regan speaking before the Toronto Advertising club recently. Mr. Regan is of the advertising firm of W. H. Rankin, New York and Chicago.

Negotiations at Acton, Ont., have been completed with Amos Mason of that city, turning over the old power house building and adjoining land for the establishment of a wooden mill. The new proprietor expects to have machinery installed and ready for operation within about two months. It is intented to manufacture knitted goods for children.

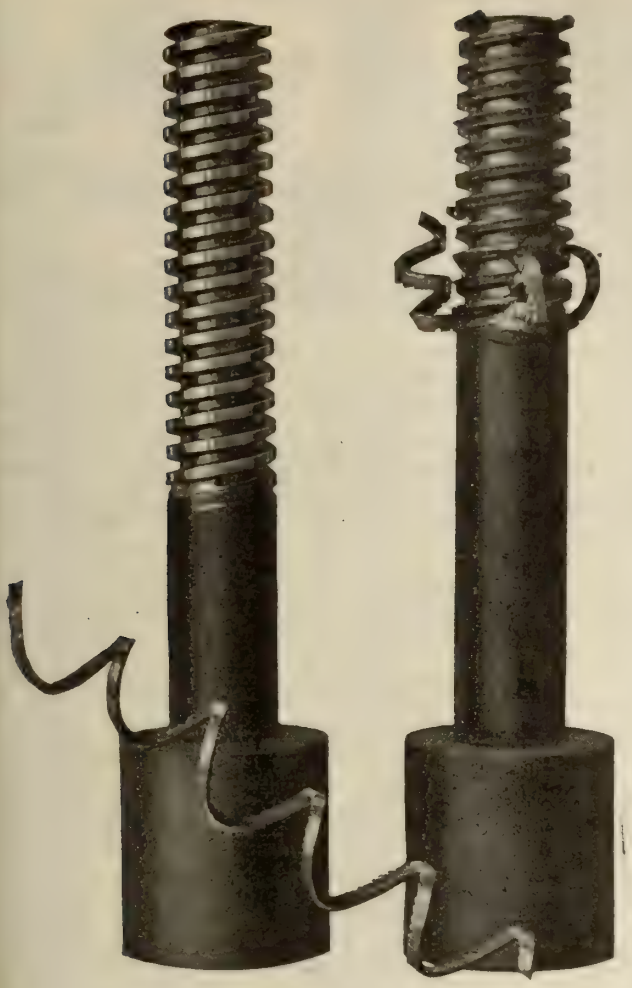
Oshawa is to have a new industry. The Ontario Potteries Co., which started in a small way in Bowmanville a few months ago, has decided to locate in this town. Representatives of the company are at present endeavoring to secure either a site for a small building or else an empty building in which temporary kilns may be constructed. The company intend to manufacture tableware, a clay found in Bowmanville to be used largely for this purpose. The company is capitalized at $300,000 and is expected to commence operations in a very active way shortly after the new year.

Representatives of 17 United States industries have recently visited Toronto to enquire into the possibilities of establishing branches in Canada and creating trade connections. In this regard it is significant that Mr. E. L. Cousins, in the report of the Department of Industries made to the Board of Control, says: "There is no doubt that good times are just around the corner."

A good idea for industrial promotion in a town was explained by Mr. A. F. Fifield, manufacturer of St. Catharines, who paid a recent visit to Toronto. He said that during the coming summer every manufacturer in that city will make a visit to all the other plants in order that each may learn what his colleagues make. Every commercial traveler in the future will know when he leaves St. Catharines what is turned out there. The manufacturers will exchange catalogues and their travelers will lunch together so that all may become acquainted with one another's products.

The London & Western Trusts Co. will provide, it is stated, for a large part of the cost of a new office building.

Deseronto finds itself getting busier. According to the Kingston Standard the Thompson Powder Company has resumed operations. The Wood Products Company also expects to return to its usual activity at once.



The Temiskaming & Northern Railway Commission is calling for tenders for the construction of approximately seventy miles of road, extending from Cochrane to near New Post. The tenders close at noon on January 9th next.

During this winter the Canadian Welding Society will hold regular meetings to discuss matters of interests to the members. The first meeting recently was addressed by R. E. Smythies, vice-president of the Lincoln Electric Company who dealt with late developments in electric welding, with special reference to the welding of panstocks of the power house of the Chippewa canal project.

Toronto during the closing week in December, has been the mecca of scientists from the four corners of the continent. More than a thousand men have been meeting in annual convention as the American Association for the Advancement of Science, an organization which through its affiliated units has a membership of nearly 12,000. Among the outstanding men is Dr. Frederick C. Cottrell, Washington who discovered the valuable process of avoiding smelter waste. He distinguished himself by his scientific researches relating to the electrical precipitation of fume and fine particles suspended in the gases o fsmelter, blast furnace or cement flues and finally evolved what is known as the Cottrell process.

According to information coming through to the British Trade Commissioner in Toronto, the general industrial condition in Britain is slowly but steadily improving. Speaking broadly there was a marked betterment during October and the early part of November. That there are many hills yet to climb is obvious, but reports indicate a decided spirit of optimism.

A glimpse at the industrial developments of Western Canada reveals that British Columbia has enjoyed the lead in capital investment. According to a preliminary survey of the manufacturing affairs of the four western provinces, prepared by the Dominion Bureau of Statistics, there were, as at the close of 1919, some 6,599 plants and factories in operation. The total capital invested amounted to $482,498,201. The number of employees on salary was 13,084 and those on wages 86,410. The amount paid out in wages was $97,392,944. The cost of materials used in construction amounted to $283,179,527 and the products were valued at $550,672,135. British Columbia stood first in investment with Alberta, Saskatchewan and Manitoba in sequence.

It Was Just A Matter of Grinding

The same set of Thread Chasers cut these two threads.

Observe what a clean cut the Chasers gave on this open hearth stock after they had been correctly ground. Note how neatly the Chasers curled out the chip. Before given the right form of grind, the Chasers simply pushed out the stock.

How To Grind Thread Chasers

Instructions for the Care of Thread Chasers are very completely given in a 27-page booklet published by us.

The Book Is Free

To those having the care of Thread Chasers.

It is printed and distributed with the hope that the rules given will be followed, and if they are, it will be the means of an inestimable saving of time, money and trouble.

If you have anything to do with the care of Thread Chasers, ask us for the book. Although there is no charge for the book, it is full of value. It will cost you the price of a postage stamp only, and will save you trouble, increase your value to your employer and save a lot of money that is needlessly wasted in time and scrapped work.

ATKINS
METAL CUTTING SAWS

Solve your Metal Cutting problems, easily, quickly and economically, by adopting the products made by

ATKINS

We make Kwik-Kut Power Hack Saw Machines which use practically the full cutting edge of the Hack Saw Blade at each stroke; Metal Cutting Band Saw Machines for general shop work, cutting all classes of metal up to 12 x 14 inches.

Your requirements for Metal Cutting Circular Saws can be supplied promptly and we solicit a trial of our "AAA" Non-Breakable and Power Hack Saw Blades and Frames.

"A Better Saw for Every Use"

E. C. Atkins & Co.

AN IMPORTANT QUESTION

For the Advertiser to Answer

Is the Publication Soliciting Your Business a Member of the Canadian National Newspapers and Periodicals Association?

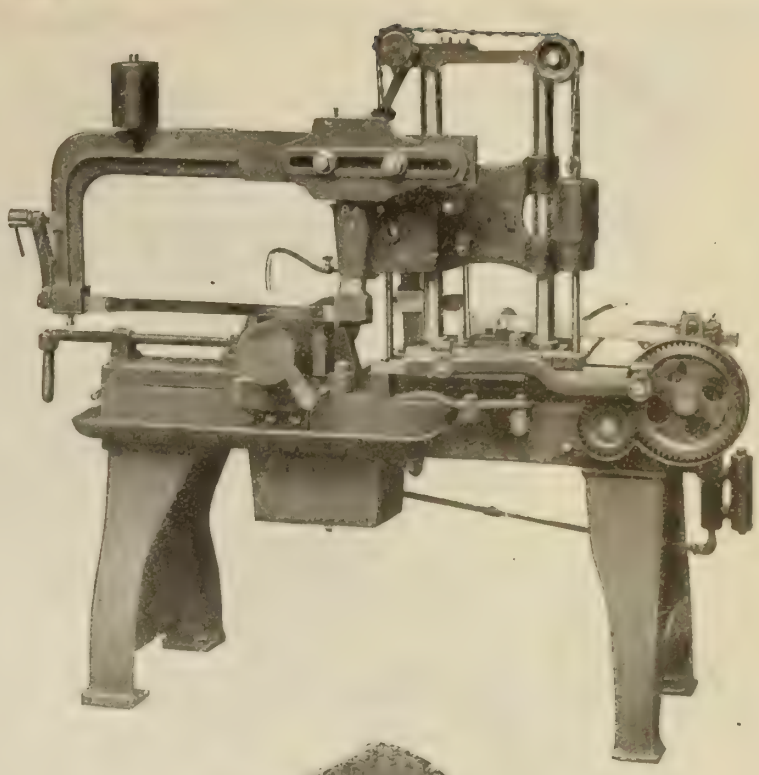
YOU would never engage a man on an important piece of work until you gained a thorough knowledge of his qualifications. It would not be wise. You first of all require a clear record of his character and ability, in addition to a statement of his aims and aspirations. When you are in possession of this information you have a real basis for judging his fitness to serve you.

It is just as important that you should know the character, ability and aspirations of the publication in which you desire to carry your business message.

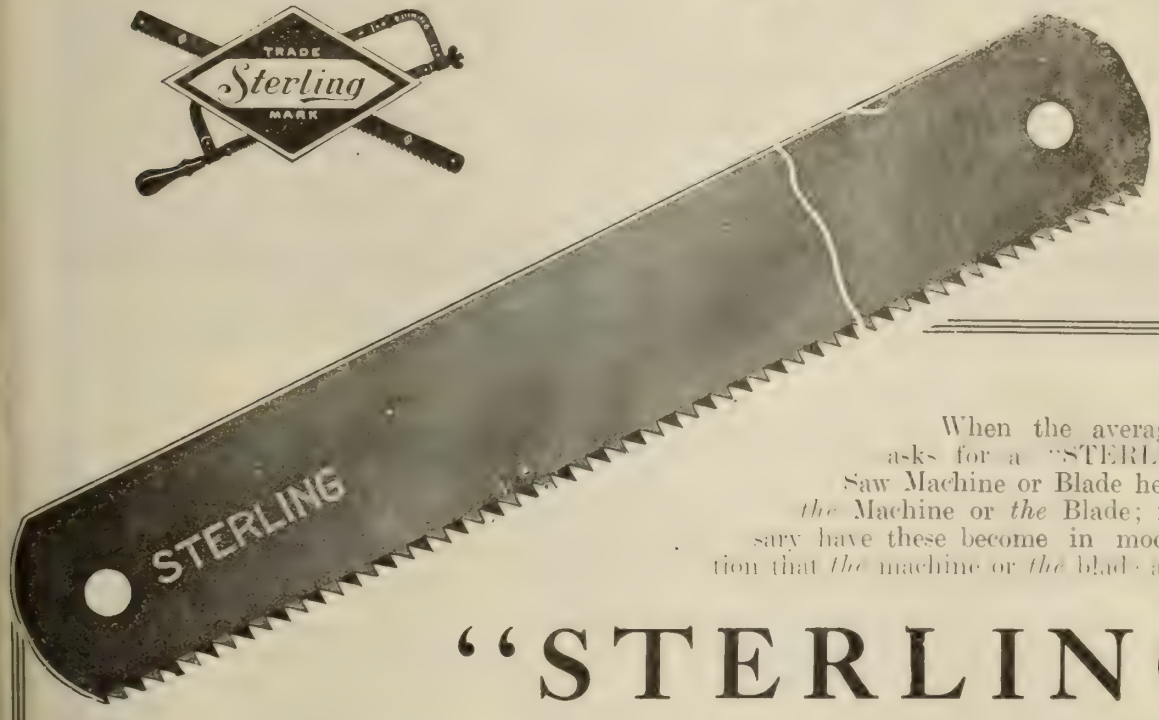
You should know if the paper is circulating and has an influence among those men who are responsible for results—the men who buy, or influence the buying, of machinery, tools, power and any other equipment or merchandise which you may sell.

Facts are essential. When you are in possession of the facts you can make every dollar spent for advertising a judicious investment. To enable the advertiser to make such judicious investment is the purpose of Canadian National Newspapers and Periodicals Association. From this Association the advertiser may secure complete information concerning the character and aims of the leading Canadian publications. The facts are fully presented for your consideration—and they are presented RIGHT.

CANADIAN MACHINERY



is a member of the Canadian National Newspapers and Periodicals Association, along with the following publications which constitute the Association's Technical Newspapers Section:



Canadian Engineer
Canadian Foundryman
Canadian Machinery
Canadian Manufacturer
Canadian Railway and Marine World
Construction
Contract Record and Engineering Review
Dominion Dental Journal
Electrical Dealer & Contractor
Electrical News
Marine Engineering of Canada
Municipal World
Power House
Sanitary Engineer

Canadian National Newspapers & Periodicals Association

70 Lombard St., Toronto

Production Depends on *The Machine* plus *The Blade*

When the average mechanic asks for a "STERLING" Hack Saw Machine or Blade he simply says *the* Machine or *the* Blade; for so necessary have these become in modern production that *the* machine or *the* blade always means

"STERLING"

The Machine

The model shown above is a No. 3 A Improved Power Hack Saw Machine. It has a frame of exceptional durability; readily adjustable to take blades of varied lengths. Automatic lift on return stroke insures maximum efficiency and long life for the blade. Plunger pump. Do you want particulars?

The Blade

No matter how good one blade cuts it's of little use if the rest in that box aren't of the same standard. In buying "STERLING" Hack Saw Blades you get uniformity, all blades being carefully inspected before packing. Blades cut true, cut fast and last long.

THE BRITISH GOVERNMENT

(DEPARTMENT OF OVERSEAS TRADE)

announces that the eighth annual

BRITISH INDUSTRIES FAIR

will be held at

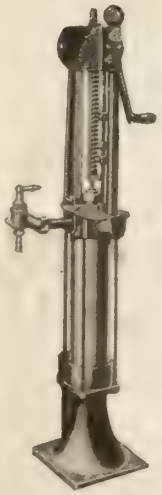
LONDON and BIRMINGHAM

from

27th FEBRUARY to 10th MARCH, 1922

All Canadian buyers are cordially invited to attend
A particularly fine and comprehensive range of

GENERAL MACHINERY, FOUNDRY APPLIANCES & SMALL TOOLS



will be shown in addition to many other lines of manufactured goods.

Goods can be examined, values compared and contracts concluded at the Fair with the minimum of trouble and the greatest saving of time.

Full information and complimentary admission cards are obtainable from:

H. M. Senior Trade Commissioner, 248, St. James Street, Montreal.
H. M. Trade Commissioner, 260, Confederation Life Building, Toronto.
H. M. Trade Commissioner, 610, Electric Railway Chambers, Winnipeg.

Clean Gasoline—Easily Available

Write for Illustrated Booklet C-13

The gradual return to 100% production and the change from a seller's to a buyer's market demands that manufacturers reduce their overhead to a minimum.

An important step in this direction is the installation in your plant of Bowser Piston-Type Measuring Pumps for storing and handling gasoline.

Bowser Equipment will save you time and labor by giving you an easily available supply, no matter where the gasoline is needed. Bowser Pumps guarantee to manufacturers clean, dry gasoline and afford an accurate check on all disbursements. Bowser accuracy eliminates spillage in transfer and the perfected construction makes evaporation impossible.

There is a Bowser Piston-Type Measuring Pump to meet your every requirement.

Bowser Equipment is MADE IN CANADA by

KEYSTONE
Steel Split Pulley
made by
DODGE

EXAMINE the small sketch closely. It shows you a big reason why Keystone Steel Split Pulleys reduce bearing friction, lessen power losses, and cut power costs.

Note the way the belt hugs the face of the Keystone oval crown, giving perfect contact over the entire face of the pulley. This means that they can be operated under very low belt tension.

The beadless, accurately turned rim assures perfect balance and true running under high speeds and variable loads.

Dodge-Keystone products stand for quality, satisfaction and long service the world over. Made in Dodge shops—the most modern and completely equipped of their kind—where forty years' experience in the production of everything for the mechanical transmission of power is built into every item of the complete line.

Of these eight widely used commercial metals-

Acids destroy

COPPER ZINC ALUMINUM

Rust corrodes

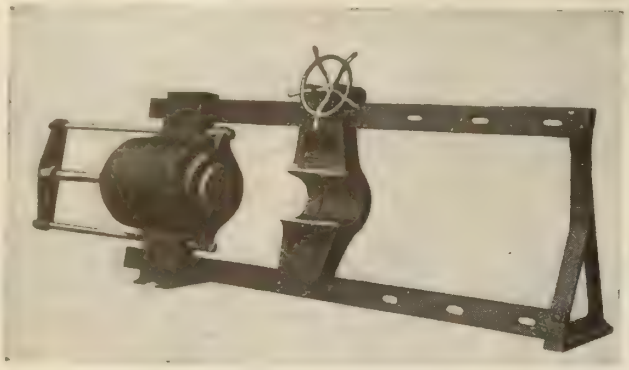
IRON STEEL

Heat weakens

LEAD

Steam wears & salt water pits BRONZE

Monel alone stands up against the many destructive forces that quickly break down the resistance of most commercial service metals. Because it is strong as steel, more corrosion resisting than copper, more wear-resisting than bronze, an increasing number of manufacturers are using **MONEL** metal for products for the most exacting and difficult industrial service, as well as for the most common domestic uses.



The name Monel identifies the natural nickel alloy—67% nickel, 28% copper and 5% other metals—produced by The International Nickle Company.

IDLE MEN IN FORGE SHOPS

(Patented)
Section showing deflection of hot gases, with induced air toward the furnace for protection of the operator and the preheating of air for combustion.

When men are idle, expensive equipment and buildings are also idle.

In past summers, the unbearable heat that caused prolonged shutdowns in many forge shops was **often due to faulty forges or improper application and utilization of the heat.**

To relieve these conditions, progressive forge shops are installing Rockwell Economizer Forges.

These forges enable the men to **work steadily and in comparative comfort.** They also afford other advantages in the way of **decreased operating cost, better quality of product,** and **decreased floor space.**

Write for Bulletin 239-T, dealing with improved methods of heating and handling material, layout of equipment, and other factors influencing the cost of production.

Cleco Pressure-Seated Air Valves

Bowes Air Hose Couplings—Cleco Never Slip Hose Clamps — Cleco Grooved Hose Nipples and Hose Clamp Tool

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.

STYLE I.F. is an Inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.

STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼ inch to 1½-inch.

STYLE O.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-inch to 1½-inch.

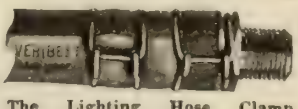
STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-inch to 1½-inch.

The Male and Female Ends of Bowes Couplings interchange in sizes ¼-inch to ¾-inch. Sizes 1-inch and 1¼-inch interchange. The 1½-inch ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-inch.

CLECO AIR VALVES.



Style R.A.

Style P.O.

Style A.

Style P.O.—Made in sizes ¼ in., ⅜ in., ½ in., ¾ in., 1 in., 1¼ in., 1½ in., 1¾ in., and 2 in. Pipe Outlets. Inlets are one pipe size larger.
Style A—30° Angle Valves, are made in sizes ½ in., and ¾ in.
Style R.A.—Right Angle Valve, made in sizes ¼ in., ⅜ in., ½ in., and ¾ in.

CLECO GROOVED HOSE NIPPLES

Grooved Nipples when attached to the Hose with Wire Clamps as illustrated cannot "blow out." Wire clamp tool shown below applies the wires to hose.

The Lighting Hose Clamp Tool illustrated applies wire clamps at a cost of 1½ cents each.

In stock: Riveting and Chipping Hammers, Air Drills, Emery Grinders, Sand Rammers, etc.

Use Annealed Wire No. 14

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and Cleco Valves, which will stop costly leaks.

Bulletins Nos. 46, 48 and 51, mailed on request.

THE MODEL HOSE LINE illustrated shows correct styles of couplings and valve to use and proper way to attach the Cleco Never Slip Hose Clamps to Bowes Couplings. No "blow-offs" can occur when "Cleco" Clamps are used.

The Kind of Wiping Cloth *You* Would Order!!

CLEAN!

All Dust Removed - Sterilized at 240 Degrees

IF YOU had to use a Wiping Cloth, you would make sure first of all, that it was **clean**. You would not want to endanger your own health with a rag of doubtful origin. Why then ask your employees to use Wiping Cloths that are a positive menace to health?

As Pure as the Most Carefully Laundered Linen

SUNCLO Wiping Cloths are first boiled with an extra strong solution of soda. They are then washed with soap, and after several rinsings in fresh water, they are dried and sterilized at the extreme temperature of 240 degrees. So clean are they that they can be used in the home without the slightest hesitation.

Cleanliness is not the only feature. The rags are cut to usable sizes; buttons, hooks, etcetera, are carefully removed, and the finished Wiping Cloths—soft, free from anything likely to scratch or mar the finest surface,—are packed in neat and compact bales.

Be sure in your next order for Wiping Cloths you specify—SUNCLO—The Wiping Cloth of Merit.

POLLARD
PLANERS

Made in Canada

Best in the World

—Save Workmen's Wages

Advantages—The advantage of the openside planer is, of course, "the open side," the absence of a limiting distance between two posts. Long pieces can be cross planed to advantage. Work wider than the table can be planed on such a machine, where a two post machine of perhaps twice the size and initial cost would otherwise be required.

For regular production work the openside is equal in every way to the two post design of machine.

It has advantages. It has no disadvantages.

SPIRAL GEAR DRIVEN

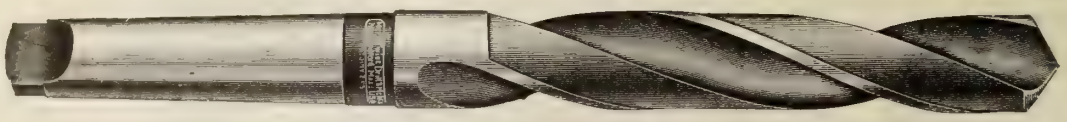
Belt troubles eliminated. Smooth running at high speeds. Long life and minimum power.

ATTACHED COUNTERSHAFT

All shafting independent of building. Belted direct from motor or line shaft.

SIDE HEAD DESIGN

Power raise and lower is an original feature, insuring increased speed and additional comfort to operator.



SIZES

42 in. wide. 48 in. high, lengths 12 ft. 0 in. and 14 ft. 0 in.

Murchey Taps

Get Out Your Tool Work in One-half the Time

Doesn't this sound interesting to you? Doesn't it sound convincing enough to specify Murchey Collapsing Taps in your next order? You'll find by actual experience that every word of it is true. Murchey Taps and Dies will actually boost your production fifty per cent. and do better work than ordinary tools.

Collapsible Construction

The Collapsible and adjusting features of Murchey Taps enable convenience and quick-acting operation. Built for speed, they maintain their rigidity under the heaviest strains.

Murchey Tools have proved their money-saving qualities to others. Let them do the same for you. A sample Murchey Tap and Die will be sent on approval by writing us.

Machine-Moulded Gears

"H I S C O" machine-moulded gears, while requiring no pattern, insure accuracy, dependability, quality, and the price is minus the cost of patterns—which in these days of high prices of lumber is something to be considered.

Specify "HISCO" Products

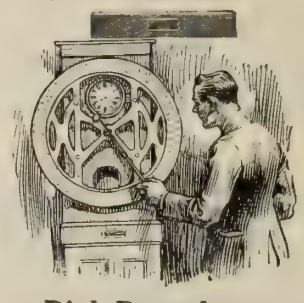
What an eminent authority says on costs:

The correct basis of distribution of rent, insurance, taxes, repairs and depreciation is **time.** It is clear, also, that such expenses as power, light and heat when applied to actual productive operations are logically distributed on a **time** basis through a machine rate.

DEXTER E. KIMBALL, M. E.

Professor of Machine Design and Construction, Cornell University.

Your Chief Cost is TIME and Your Chief Loss is TIME



WHEN you thing of costs—as all business is doing today—think of Time, which chiefly governs those costs. Time is at once the most expensive and the most elusive factor in a business. It should receive first attention when increased efficiency and economy are sought.

Job Recorder

Card Recorder

Dial Recorder

International Time Recorders

keep time mechanically: encourage punctuality and full-time production; stop time leaks and provide full and accurate data for correct payrolls, greatly reduced clerical work and expense.

International Job Time Recorders complete the protective policy by showing the exact distribution of time in each working day, job by job. They supply necessary cost-keeping records, improve superintendence, link each day's working hours with the actual results accomplished and give every minute its true production value.

Internationals are made in 260 models, either electrically-operated or spring-driven and adapted to all lines of business.

May we show you how YOUR requirements can be filled perfectly?

A MESSAGE FROM I.B.M. CO.

Are You Equipped to "Turn the Corner"?

Are you waiting?
If so, what are you waiting for?
Business is on the move! The head of the procession **has already turned the corner!** Are you going to be a pace-maker or a tail-ender? Use your accelerator! What are you waiting for?

* * * * *

Business is on the move! How do we know? Just a moment—and we'll give you the story in figures. Nothing is more responsive to the quickening and revival of trade than the demand for International Business Machines. Glance at the sales records of the International Time Recorder, the Dayton Scale, the Electric Tabulator, in these you have the real **speedometers** of Business Progress, and here is what the records show:

INTERNATIONAL TIME RECORDERS—Sales within the last two months increase 40 per cent. over those of preceding four months.

DAYTON AUTOMATIC SCALES—Sales to date in 1921 increase 18 per cent. over those of 1920.

INTERNATIONAL ELECTRIC TABULATORS—Sales in 1921 increase 20 per cent. over 1920.

* * * * *

Ponder these figures and you know what employers of labor, and the men in the mercantile field all over Canada, are thinking and doing. The men and the firms that "turn the corner" first are those who reduce overhead and improve their merchandising with the modern, high-class International Business Machines.

* * * * *

What are YOU waiting for?

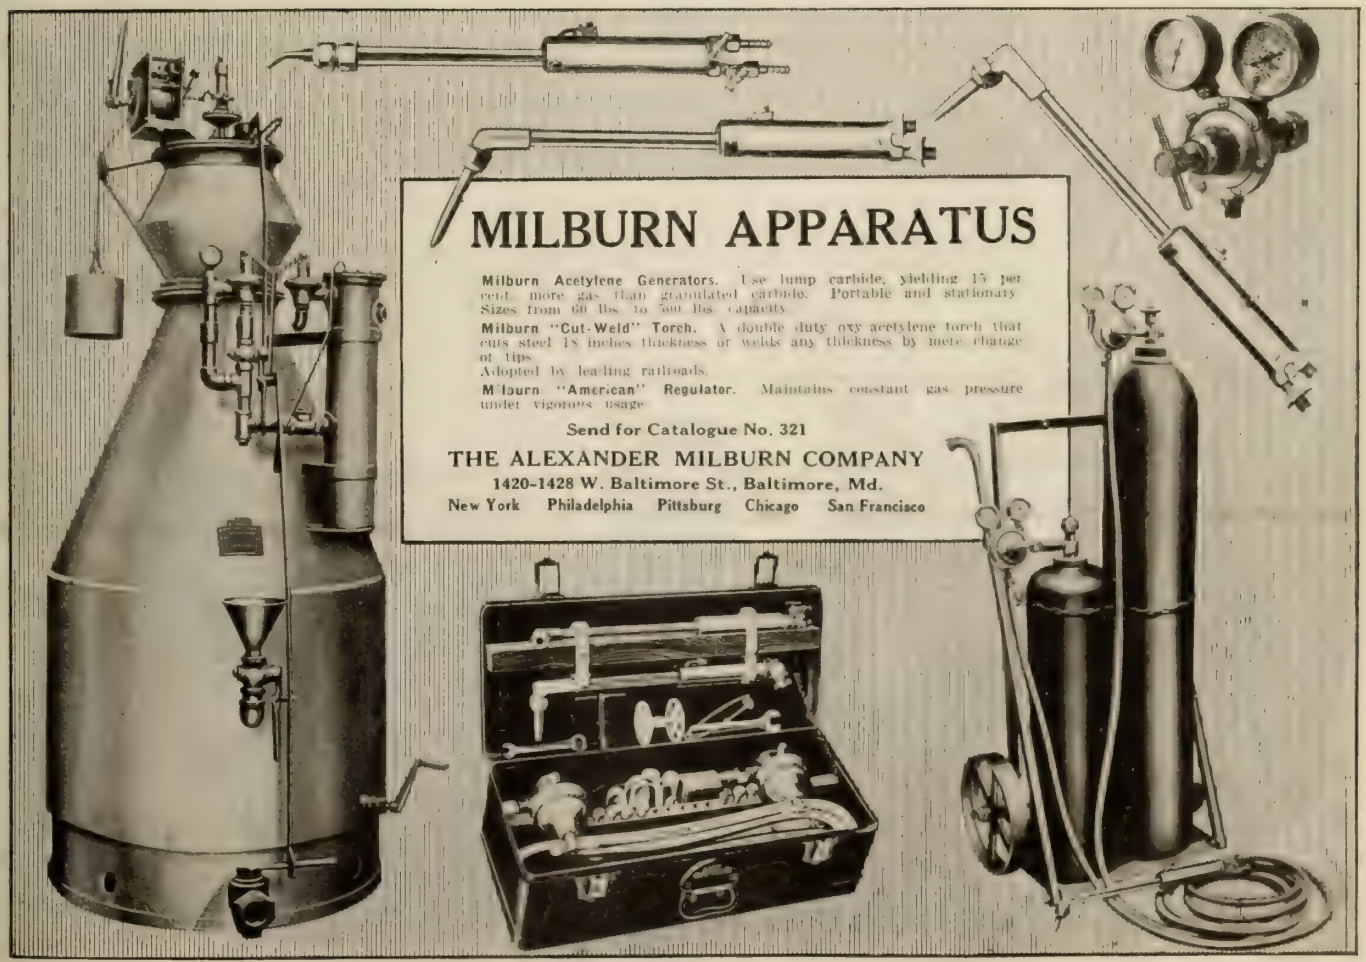
ETNA SWAGING MACHINES

In the Manufacture of Auto Accessories



as well as a wide variety of Industrial Products, many firms find production put on a **better quality** and **more economical** basis by the use of Etna Swaging Machines.

Etna Swaging Machines are capable of continuous, unrelenting hard work. They will outlast any other swager made. Built in all sizes from one-half inch diameter to 4-inch diameter.

The Etna Rotary Swager is a rugged, well-proportioned machine — a credit to any establishment. It gives the same results as hammer blows, while eliminating all waste.

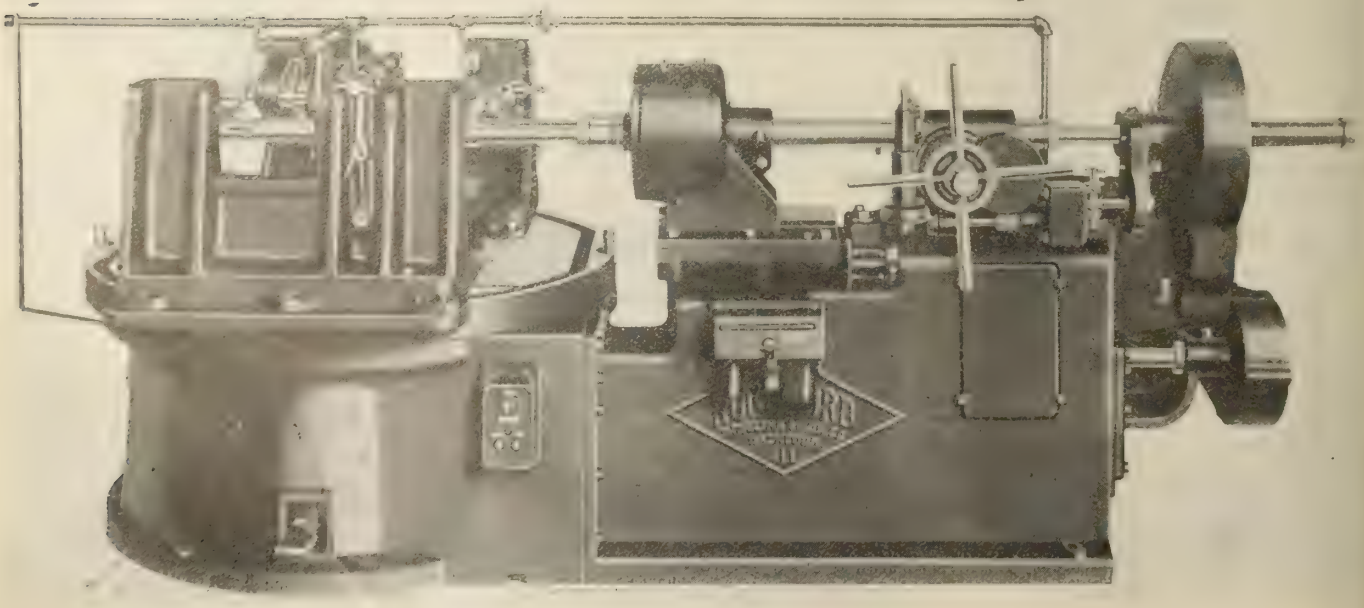
Special Etna Swagers can be made where desired. Have our Engineers advise you. Enclose prints when writing for catalogue and production estimates will be furnished.

THE ETNA MACHINE CO., TOLEDO, OHIO

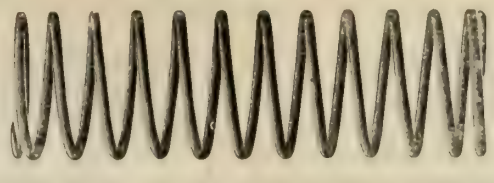
Rockford

Horizontal Boring Machine

For Heavy Duty



HIS type of Rockford is unexcelled for continuous production. It is of the single end type equipped with two spindle drive head and indexing table, complete with fixtures, cutters and line bars. Its construction insures continuous production of the first quality and continued accuracy. There is no machine which so well meets the requirements of accuracy, production and adaptability as does the Rockford.



The drive is directly by motor with interchangeable pick-off gears for speed changes. The table may be indexed 180 deg. to bring both fixtures in turn into operating position. One fixture is being loaded while the other is in operation.

Complete equipments are a Rockford specialty. This equipment is the choice of most automotive engineers for solving their boring problems.

Specialists in Dependable Springs

INDUSTRIES of all kinds recognize the Value and Merit of P. P. P. & EBONITE

Actual experience has demonstrated to engineers, from all parts, that Daniel's P.P.P. Rod and Ebonite Sheet Packing are the best and most economical for them to use.

P. P. P. Rod Packing

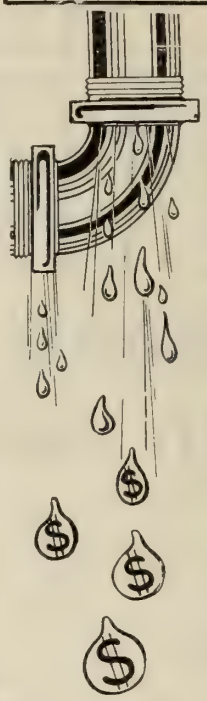
Constructed on a scientific principle of sliding wedges and compressible cushion, making the packing self-setting.

P.P.P. in the stuffing-boxes of your engines, pumps, compressors, etc., will greatly increase the efficiency of your plant as well as reducing operating expenses. The reasons why are explained in detail in "The Story of Some Friction Tests" mailed free to any Engineer.

EBONITE Sheet Packing

A high grade black sheet packing that will not blow out, crumble or rot. Will hold your flanges and joints absolutely steam tight. On vibrating lines Ebonite has no equal.

Orders for P.P.P. and EBONITE during the past month show that many industries have taken on increased activities.



The fact that others are securing the benefits by their use will not help you or your plant.

If you are not using these packings place an order today.

Sheer oversight is sometimes responsible for a file being kept in use after its keen-cutting edge is gone.

The result is loss of efficiency, wasted time and effort.

The remedy is: discard a file at the first hint of wear, and buy a new one.

Best results will be obtained by specifying one of these famous five brands, the standard for over fifty years.

TRADE MARK
BRISTO
REG. U. S. PAT. OFFICE
PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

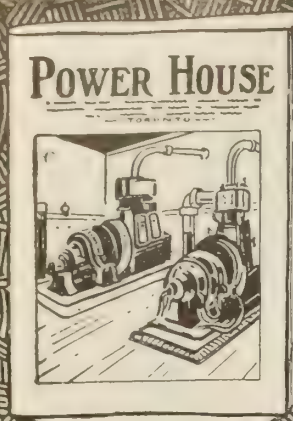
Machining Hardened Tools

Many difficult operations are made possible through the perfect running balance—rigidity—correct peripheral speed of wheels—absence of lateral or radial play—and portability of Dumore Grinders.

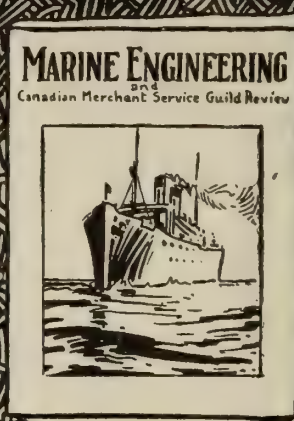
The illustration above shows the Dumore set up on a milling machine correcting inaccuracies caused in hardening a blanking die. This combination enables you to obtain accurate centers and perfect finish on hardened metal jobs.



The Dumore can be operated in a vertical position so that the job may be set up on a circular milling attachment.

It can be used anywhere; taking power from the nearest lamp socket.

There is a Dumore for every grinding problem. Ask the man who uses one. Send for our complete catalog and then have your dealer demonstrate the type that meets your particular need.



Wisconsin Electric Company
2941 Sixteenth Street - Racine, Wisconsin

DUMORE HIGH SPEED GRINDERS

For

Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working —marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month—$2.00 per year.
Serves the power plant engineer—Steam, Electric, Refrigeration, Hydraulic.

CANADIAN MACHINERY

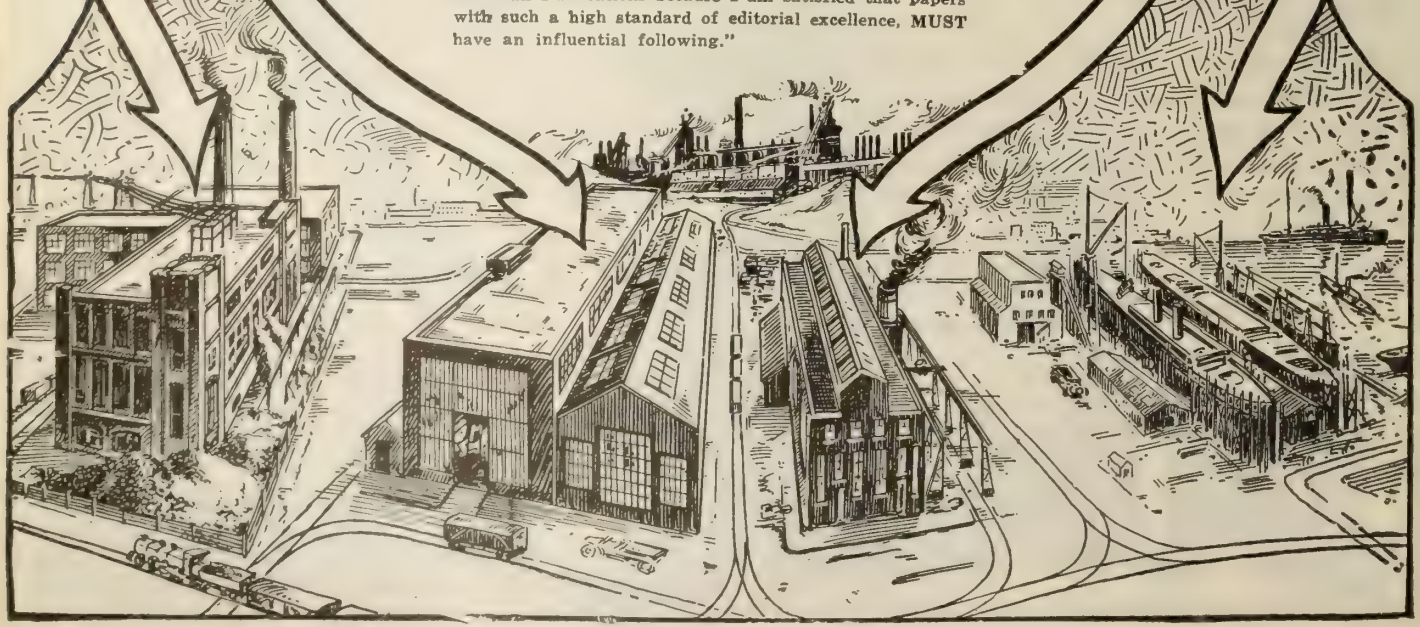
Weekly—$4.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$2.00 per year.
A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broadest sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)



Published by

THE MACLEAN PUBLISHING CO., LIMITED

CANADIAN HART GRINDING WHEELS

Vitrified—Silicate —Shellac

Canadian Hart Vitrified Wheels—recommended for the majority of grinding jobs. May be used wet or dry; give better all-around satisfaction and have a longer life.

Canadian Hart Silicate Wheels—can be made in twenty-four hours and are often substituted when it is inconvenient to wait the required length of time for Vitrified Wheels.

Canadian Hart Shellac or Elastic Wheels—indispensable for slotting work where a thin wheel is required, or for work requiring a special finish. Can be operated wet or dry.

Canadian Hart Products Limited

Hamilton, Canada

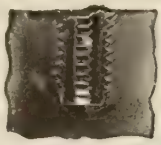
Tell Us The Class Of Work

Then We Will tell You the Wheel to Use

You can secure valuable help by placing your grinding problems in our hands. We assist you to secure the right grain and grade of wheel for every class of work. Use the right wheel and you will save a lot of time, trouble and expense. Tell us the class of work and we will tell you the wheel to use.

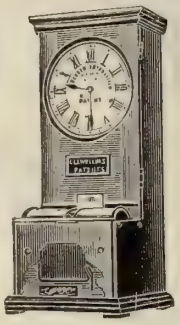


If interested tear out this page and place with letters to be answered.

Buried in the Work and Broke!

Next time a tap breaks below the surface of a large casting, don't let some makeshift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy



And save the casting.

Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.

Sixty-day trial offer proves the Walton Extractor pays for itself. Write.

KEMPSMITH

A Tool is Judged by its Makers!

We don't buy machine tools these days without finding out something about the firm that makes them; for a machine tool cannot be efficient unless the parent plant is efficient. Hence it follows logically that the greater plant efficiency means greater tool efficiency. Canadian buyers in investigating our tools will do well to consider the **KEMPSMITH plant.**

The Ideal Plant for Specialized Tool Construction

It is located in a new and rapidly developing section of West Allis, where the ten acres we own give abundant room for expansion. There are four buildings, aggregating 90,000 sq. ft. of floor area; Machine Shop, 250x300 ft., the model shop of its kind; Pattern Shop absolutely fireproof; Power Plant a neat and complete direct connected power unit; three story Office Building. Every detail of system and equipment in the shop is carefully planned for its function in the advantageous construction of this specialized line.

All machines and parts are built in multiple lots, under a complete system of jigs, and templates, and all parts are completely interchangeable at any time. A spacious tool room is centrally located in the shop. There are also separate enclosures for rough stock, finished stock and stores, and for finishing and shipping, so planned that the parts in ordinary course of manufacture shall make an automatic circuit of the shop to the assembling and shipping floors. Recognized experts have planned our lighting systems (natural and artificial) sanitary systems, etc. Consequently the work is done under the best conditions.

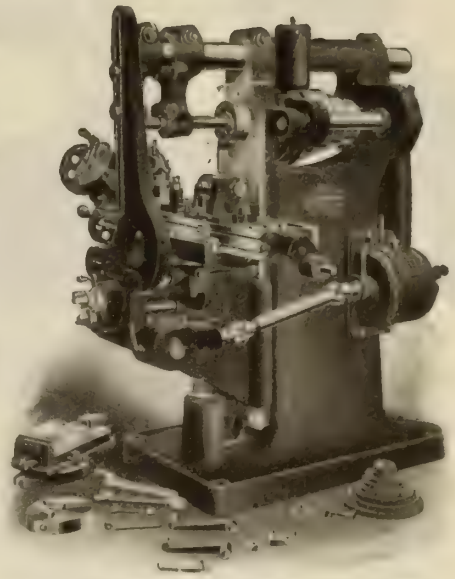
Milling Machines



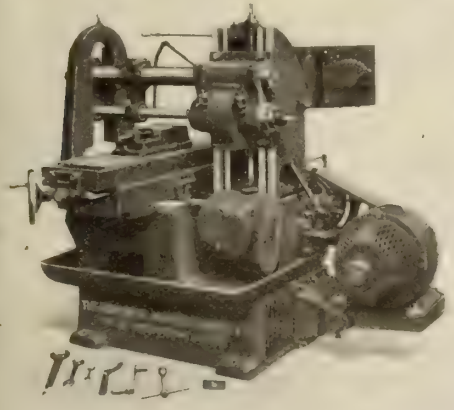
and Attachments

How Durability is Tested

Every machine, whatever size or type, is put to test under cuts and conditions purposely more severe than it will encounter in even the most progressive shops.

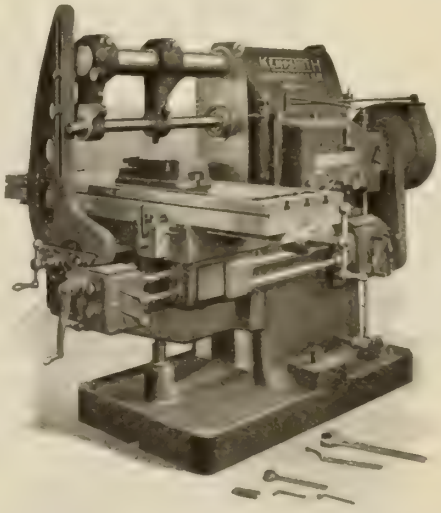
Why They Are Guaranteed

So confident are we after this test that every machine carries our definite guarantee. Note the massive proportions of the column, knee, table, etc.; the wide range of feeds; liberal bearings; the excellence of our entire feeding mechanism; the centralized location of operation at front of knee.



Cone Type Miller: A true reflection of our ideal —highest quality only.

The Three Essential Points



Summing up the foregoing you will see that KEMPSMITH MILLERS represent:

1. A machine design of established excellence.
2. A highly modern factory and equipment with specialized systems.
3. Trained and specialized mechanics under the most favorable conditions and under a system of rigid inspection.

Our line embraces plain and universal milling machines and attachments of all kinds. Write for our latest catalogue.

No. 33 Production Type Miller: For rapid and accurate production.

Maxmiller: A design which is undoubtedly the acme of present milling development.

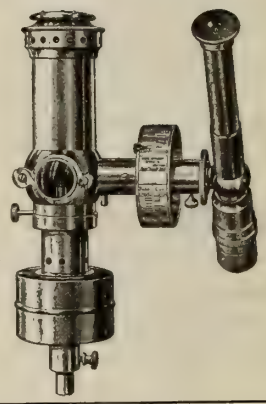
Test Your Metals with a SCLEROSCOPE

for Softness, Hardness, Strength



"Profit and loss" is apt to show an appalling debit unless the quality of materials used is assured before working up. The Scleroscope eliminates this long-standing difficulty; for it is a simple matter to establish definite standards for all raw materials and with the help of the Scleroscope any unskilled worker can see to their fulfillment.

Direct reading, can be operated by anyone with great rapidity. Measures softest metals and hardest steels without adjustment.

You would be well advised to send for free booklets explaining fully, both the "Scleroscope" and the "Pyroscope."

The PYROSCOPE

—a simple and reliable device for determining the temperature of metal in process of heat-treatment —durably constructed and requires no skill. Unexcelled for constancy, and it is inexpensive.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

Abrasive Discs
Norton Co. of Can., Ltd., Hamilton, Ont.
Oakey & Sons, Ltd., John London S.E., Eng.

Abrasive Materials
Can Hart Products, Ltd., Hamilton, Ont.
Norton Co. of Can., Ltd., Hamilton, Ont.
Oakey & Sons, Ltd., John, London, S.E. Eng.

Acetylene, Dissolved
National Electro Products Co., Ltd., Carter Welding Co. Ltd., Toronto.
Dominion Oxygen Co., Ltd., Toronto
Liquide Air Company, Toronto.
Prest-O-Lite Company, Toronto.

Generators, Acetylene
The Alexander Milburn Co., Baltimore, Md.

Accumulators, Hydraulic
Stewart & Co., Duncan, Glasgow, Scot.

Anchor Bolts
Steel Co. of Canada, Ltd., Hamilton, Ont.

Angle Bars
Steel Co. of Canada, Ltd., Hamilton, Ont.

Anvils
Aikenhead Hardware Ltd., Toronto, Ont.
Atkins & Co., Inc., E. C., Indianapolis, I.
Petrie, Ltd., H. W., Toronto, Ont.

Anchor Bolts
[illegible] Canada, Ltd., Hamilton, Ont.

National Electro Products Co., Ltd., Prest-O-Lite Company, Toronto.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

MACHINE TOOLS AND METAL WORKING EQUIPMENT

Chas. P. Archibald & Co., Montreal.
Bertram & Sons, Ltd., John, Dundas, Ont.
The Canadian Fairbanks-Morse Co., Montreal, Que.
The Garlock-Walker Machinery Co., Toronto, Ont.
R. S. Holly, Toronto, Ont.
Herbert Ltd., Alfred, Toronto, Ont.
H. W. Petrie Limited, Toronto, Ont.
The Standard Equipment & Tool Co., Montreal, Que.
Chas. A. Strelinger Co. of Canada, Limited, Windsor, Ont.
A. R. Williams Machinery Co., Toronto, Ont.
A. R. Williams Machinery Co., Montreal, Que.
Wilson-McGovern Limited, Toronto Ont.
Yeates Machinery Co., London, Ont.

MACHINE SHOP AND FACTORY SUPPLIES

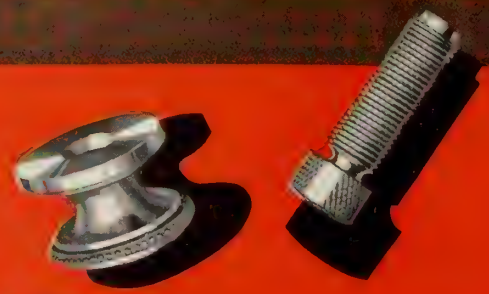
International Malleable

Everything in

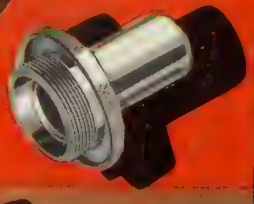
MALLEABLE
and
CAST IRON PIPE FITTINGS
and
Recessed Drainage Fittings

BOTH screwed or flanged, black or galvanized. All sizes. If you want your orders filled quickly send them to us. With our new and extensive facilities we can render exceptional service.

We can quickly fill all requirements in malleable and grey iron castings for general machine shop work, for manufacturers of automobiles and specialty manufacturers.



International Malleable Iron Co., Limited



Guelph, Canada

MADE IN CANADA

Namco Parts
For Auto Accessories

It makes no difference whether you need—One thousand tiny Adjusting Screws—Ten thousand Hardened and Ground Spring Bolts—or any other kind of milled parts up to 2¼ in. diam. Our well-equipped product plant is at your service.

Extensive knowledge of special operations and a mechanical equipment for practically every variety, enables us to take care of new and highly specialized products without the loss of time caused by slower methods, or the cost of experimenting to find quicker ones.

Standard Cap and Set Screws, also Finished Nuts and Studs from stock.
